## Enables city to use existing source

Just a few years ago the modern, half-million dollar filtration plant for the water supply of a small city seemed doomed to abandonment. With the methods employed, the bacterial content of the finished water could not be properly controlled. Break-Point Chlorination was then adopted . . . with the remarkable results shown above.

The water now meets exceptionally high bacteriological standards and tastes and odors have been reduced . . .

with a substantial reduction in overall chemical costs.

This progressive plant is one of many where the maintenance of *free available chlorine residuals*, by chlorinating beyond the break-point, provides extra safety.

Safer, more palatable water, may be one of the civic improvements your citizens will expect soon. To be ready, check now with your W&T Representative on what Break-Point Chlorination can do for you.

## Relationship of the Utility Operator to the Village Officials

*By I. M. Hoover*

Supt., Montpelier Water Works, Montpelier, Ohio

Presented on Oct. 26, 1945, at the Ohio Section Regional Meeting, Massillon, Ohio

**O**FFICIALS in the average village are elected every two years and usually are, with a few exceptions, men of every type of personality and representative of any profession from pool-room loafer to college professor. The mean intellectual level of the group, with few exceptions, is near the mean of the community in which they live. After a term or two in office the pre-election enthusiasm of the officials usually "dwindles out" for they have found that the problems of operating a village are much different from what they appeared to be before the election.

Although the mayor is usually looked upon as a sort of village manager, he is in fact very often limited in legal power which concerns the operation of the utility. He may approve or veto the ordinances which are passed by the council. However, most citizens take all their troubles to the mayor and ex-

pect him to correct a taste in the water or a flooded basement and to make sure that the drunken husbands get home and chase the chickens out of the victory gardens.

The village council has many legal duties and powers, but of particular interest to the utility operator are the ordinances which affect the operation of the utility and the appropriation of utility funds for yearly operation and major improvements. In most villages the council follows the recommendations of the board of public works in legislation affecting the utilities, unless there is friction or a lack of co-operation between the two groups.

The board of public works is charged with the complete operation of the utilities, which includes the personnel, the fixing of rates, the collection of revenue and the maintenance and extensions of the utility, and the operator is

directly responsible to this board in his work in the utility.

How can a village operator get along with the village officials?

The operator should know personally each official, especially those on the board of public works. He should know each man's business and how he conducts it, his education, his likes and dislikes and, very important, his weakness, so that the proper approach to each man may be followed in making suggestions for changes or recommending improvements in the utility operation. In nearly all groups of officials in a small town there is usually a leader who controls the majority of the group and it is the operator's problem to know that leader, to work with him and to sell himself and his plans for the successful operation of the utility. This leader may say "no" to an operator's suggestion, or, still worse, he may say nothing and do nothing about it. Then the operator must exercise judgment on when to bring up the subject again, for sometimes it pays dividends to give plenty of time for the "soaking-in" period to work on your man and it should be remembered that most men do not like to be rushed into a decision on a problem of which they know very little. However, if it is an important problem of safeguarding the water supply you can always report to the department of health and ask them to given you help in obtaining a decision on the problem. It has been the author's practice to confer with the health department first and then put the problem up to the local officials for action. If your problem concerns an imminent breakdown of the plant or the lack of material or equipment, report it to the officials with your recommendations, and, if you can get no decision, you are at

least on record. Then if the breakdown does occur, the blame will be laid on the officials who failed to take action on your recommendations. Always keep ahead of your officials on such problems; then you can call their attention to it before they have the chance to bring the problem to you, keeping them so busy with your suggestions that they do not have time to look for the little things that might be only an annoyance to you but which may seem very big to them.

You may have an official who has personal antipathies toward certain citizens of your village and if he is called upon to make a decision which affects these "certain citizens," most of the time he will let his personal dislikes rather than the consideration of what is right and fair sway his decision. It seems to be a sort of indoor sport in a small town to try to "get even" with the people who are disliked.

Another type of official is the one who thinks that he is directly in charge of the utilities and that the operator or manager is a sort of "hired man" in the utility organization. This official is full of suggestions, both good and bad, although he has no experience or training in the utility field. This type of man usually has a considerable amount of conceit and wants the citizens of the village to think that he has been responsible for the successful operation of the plant. If the plant does not operate successfully, however, then it is the fault of the operator—"the no-good scoundrel."

The author recalls one experience with the Board of Public Affairs in his own village, on which there was a man who would never favor any suggestion of the operator which was put before the board in a regular meeting. Then the operator once unintentionally

mentioned that he expected to suggest some new equipment at the meeting that night. The board member asked about the reasons for the equipment and seemed to favor the plan, so the operator obtained his agreement to bring it to the attention of the other members of the board that evening. This board member opened the discussion by saying that he had been thinking about the purchase of new equipment for a long time and would recommend that it be done at once. Of course it was purchased. From this incident the operator learned to discuss his problems with this board member before a meeting and let him bring it before the board as his own proposal. It would thereupon always be favorably voted on. This method of getting things for the utility satisfied the ego of the board member, who wanted only the credit for the idea, and for fifteen years it got the things that the operator wanted.

There are other types of officials with whom you may deal. For example, there may be a businessman who condones shady operations in his own business, who will stretch the truth for a thin dime. He may be expected to do the same thing in any decision on a public matter.

Another type of official is the one who changes his mind on a problem every day and the operator never knows how this official will vote when the final decision is to be made. This type of person is usually one who is not equipped for the office to which he

has been elected and is afraid to follow or to take any advice from men who can give the right answers to the problem.

There are many more types of officials—the man who will never change his mind when wrong; the person who always appears to be bored in a meeting and who will not give a question the time required to make a fair decision but who keeps wanting to adjourn the meeting and go home; or the official who would rather tell ancient off-color stories than consider the problems vital to the operation of the village utility.

It is the responsibility of the operator to try to find some way to get along with the public officials, for they will never spend much time trying to get along with the operator. They would rather hire a new operator. It has been observed in the operation of village utilities that a very great majority of public officials have been honest, have tried to work for the best interests of the village and have worked many hours for little or no salary. Sometimes I think they are an unappreciated group.

It should also be remembered that there are as many types of personalities among the operators of utilities as among the public officials by whom they are employed, and it might be well for the operator to make a self-analysis to determine if he might make some changes that will help him in his relations with the public officials of his village.

# Public Relations in the Water Works Field

By E. L. Filby

Engr., Black & Veatch, Kansas City, Mo.

Presented on Oct. 16, 1945, at the Southwest Section Meeting, Shreveport, La.

**E**VERY water works man is a daily practitioner in the field of public relations, for he is engaged in essential public service and in such service is the servant of the American public. A servant—yet beloved as any family member. We, as servants, have performed our duties so unobtrusively—so efficiently—that the public has taken us for granted. We have inherited the title of Kipling's "Sons of Martha," handling forever the burdens the Sons of Mary have passed to us—and with the compliance that comes over persons engaged in so-called routine jobs—we do our daily jobs, we see that certain duties are carried out and then we retire within a shell we have created. We have lost the enthusiasm with which we undertook our first public service job; we have lost our pride in performance well done; we consider our "essentiality" something of no importance; we have put our public relations away in moth balls—if you will!

What are you doing in your city to create good public relations? Well, you say, I am giving the public a good safe water, properly conditioned and at satisfactory pressure—24 hours a day, 365 days a year, and for that extra day in leap years—the same service. Right you are—that is the job to which you are devoting your life—a service essential to modern-day civilization and happiness. But, how about telling the folks about it? Toot your own horn, or, if that is personally ob-

jectionable, toot your department's horn. But, you say, actions speak louder than words—yes, but who hears about that break on South Main Street at 2:00 A.M. that you had fixed by 6:00 A.M. and so had water service on before the business day started? Who hears about the water department in the case of a bad fire? Right, you do, if the fire department needs an alibi. You hear about it from the "powers that be." But, when you receive word that your water supply has passed all the minute tests of the U.S. Public Health Service and has been fully approved for use in interstate carriers, trains, buses, planes—who hears about that? You do, but who else? The old adage of the beaten path to the developer of a better mousetrap has been modified in this age, and the man with a superior product advertises it—tells the nation all the excellent points of his product. Who toot their horns about service? The railroads, the bus lines, the street transportation system, the electric power industry, the gas companies, service institutions—why in Kansas City, our public library is on the radio by transcription and issues a monthly note about its service to the community. All "service" institutions—why not the water department?

Public relations—let's reverse it—relations with the public. How are your relations with Mr. J. Q. Public? Does he know of your plant, your system, your problems, your accomplish-

ments? Or are your relations with him limited to hearing him growl about that \$1.02 minimum bill which he stops by to pay once a month? And when it becomes \$1.75 because Johnny Jr. left the hose running does he howl! You hear about it then, and there is your opportunity to make a staunch supporter or a disgruntled customer. And the City Dads—the board of directors of the corporation in which every citizen is a stockholder—do you report to them regularly and in a manner that holds or creates interest? Or do you turn in a maze of figures no one is especially interested in? You produced 16,432,000 gal. last month and got paid for 12,650,000. That doesn't sound very exciting, but you could make it "newsworthy" by saying that you were paid for only 77 per cent of what was delivered to the system and 23 per cent, or nearly one-quarter, was lost or not recorded on the cash register. Or, if you tell that last month every man, woman and child used 185 gal. of water per day as against a seasonal normal of 115 gal., someone will ask why, and there is an opportunity to show that for the 106 flat rate services you received \$106 in revenue and a like number of metered customers produced \$156 in revenue. "Hm," will come the response, "\$50.00 a month more. Maybe, Jim, you had better start metering those flat rate users—start with the schools and larger residences."

Your salary, you may say, is a personal matter. It is. But it is also a public matter, for it is given in public records of budgets, payrolls, etc. When you had to give common labor twenty cents an hour more last year to hold the few "good" men left, did you get a raise in like proportion? Perhaps you are a "good" man too—well, did you get a raise . . . before the war? Let

us see. Your system is a small one, worth \$600,000 at pre-war prices. A \$600,000 investment in charge of a \$2,800-a-year superintendent. Darn that word—let's change it to "manager" and let's change the salary to one that goes with such responsibilities. Your board consists of business or professional men. They know what a manager is—one who controls, directs, conducts, guides, administers—says Webster. Surely 1 per cent per year is quite reasonable for the administration of a \$600,000 investment. That would be \$6,000.

The American Water Works Association, through its Board of Directors, has become interested in public relations—in all the manifold aspects of the problem—from salaries paid to men in the industry to what is being done to sell ourselves and our organization to the general public. What can the A.W.W.A. do to promote the welfare of the water works man and to secure the just recognition of his value to the community? There is no idea of a "union" in the present-day sense of the word, but there is an idea that by working at the human side of the business we may benefit every man in the industry whether a member of A.W.W.A. or not. If, by working at national, state and local levels, we can secure the same social security benefits for the man at a municipal water plant job as pertain to a similar job under private ownership, then we have helped every one in our chosen profession. If we can instill into the mind of our humblest worker in the pipeline crew a sense of satisfaction of a public project well done; if we can create in the general manager a sense of pride in his men, their dependability and their performance, then the water works profession is well along the road to

good public relations. Let us strut a little, let's be proud of our war record—one industry without strikes—one industry with no failure of performance charged against its record. Let us be proud of our department—our work. But, if we get an inflated ego, all we have to do is line up our automotive equipment beside the fire department's equipment. The fire chief's car is shined and polished till it fairly glistens, and the fire trucks are immaculate—the tools bright, clean and in place. How does the water department's equipment compare? Is it worthy of the water department of Xville? And, did you ever notice, the fire department is in uniform?

Advertising, yes, sir, the fire departments have "sold" themselves to the public, and yet without plenty of water "on tap," where would the fire department shine? So how about making a friend of that cub reporter who covers the City Hall—give him a story now and then—human interest—as when Tom Amiss was presented a watch after 40 years of service in the department (historical), when you installed the 500 or 25,000 meters in your system (factual), when you topped the 1-mgd. pumpage or the 50-mgd. mark. Perhaps he will prepare a series of articles for Sunday editions on the public services of the community and the water department will be the "lead" write-up. The history of the Xville water department—there is many a story through the years of development—peace times, war, drought, flood, fire, disaster.

And how about slicking up the plant, the pump station and the pipe yard? Make it a beauty spot as well as a utility unit—oh, yes, they can go together—and you'll be surprised at the result. A few dollars for shrubs, plants and lawn will yield handsome divi-

dends in good will when John Public drives a visitor past the plant and proudly comments, "that's our water plant." Bring a few rose slips to the City Dads or some bulbs to the old folks' home—do a little "apple-polishing" if you will—we are all human and we like attention. Trifles make perfection is one radio slogan—and so the little trifling items count.

Enter a water works team in the businessmen's bowling league—and don't forget petite Miss Cashier can smack Louie just as well as Big Tim of the pipe gang. A few white shirts with WATER DEPARTMENT in blue letters on the back will do a lot towards creating understanding. Ditto for soft ball leagues.

And so we could go on. Take that PAY HERE! sign down and replace it with CASHIER. You'll get your money just as easily with a pleasant smile and greeting as you will with a gruff "You owe it—pay up" attitude. Start smiling at the citizen stockholders. Invite them to see what they own, and how you protect their interests. Put a little honey into that telephone call. "Yes, sir, Mr. Smith, I'll do my darnedest to get that service turned on for you in the morning—yes, sir"—and then go do it. Don't say, "you'll have to fill out an application" or "we'll get at it as soon as we can." Remember, Mr. Smith is a part owner of the water works! Put the water department out front in public service in your community and, believe it or not, you will pull yourself up by your own bootstraps until you are the respected leader and the City Dads ask *you* what they can do for *you!!* That would be the millenium, you say. Nonsense—it is just around the corner and if you start a sound program of public relations you will be surprised how soon you reach that corner.

## Customer Accounting

*By Marshall S. Dutton*

Supt. of Water, Oak Park, Ill.

Presented on Oct. 30, 1945, at the Illinois Section Meeting, Chicago, Ill.

CUSTOMER accounting deserves special consideration and thought as it becomes increasingly evident that profits of a water department must be available not only for the maintenance and improvement of the water system, but also for the augmenting of funds used to provide other municipal services. Therefore, in the proper administration of a water department, after careful control of water supply, which includes the control of losses due to underground leakage and under-registering meters, the prompt billing and collection of customer accounts are important.

The village of Oak Park is a residential community,  $4\frac{1}{2}$  sq.mi. in area, with a population of 69,000 and a total of 12,013 meters in service as of Dec. 31, 1944. Water is purchased from the city of Chicago on a metered basis and is distributed through a booster station which has on the system a 5-mil.gal. reservoir and 107 mi. of water main. The system is 100 per cent metered. The total gallonage pumped in 1944 amounted to 2,088 mil.gal. Losses and unaccounted-for water during this year amounted to 14.26 per cent of the total gallonage purchased. Of the 12,013 meters in service, 11,528 are billed quarterly and 485 are billed monthly. Total receipts for 1944 amounted to \$415,209. A total of 51,700 meters were read at a cost

of \$5,244. The cost of collecting delinquent accounts was \$2,668.

The personnel of the department includes two meter readers who are required to read approximately 80 to 120 meters daily, except Saturday, to make one recall for overs and to note in the meter book any indication of leakage on the service, which is indicated by testing with an aquaphone when each meter is read. Some success has resulted in obtaining meter readings by using a return postcard, which is left for the customer to send in with his reading of the meter on a reproduced dial, thus reducing the necessity of further recalls and the use of estimated readings.

So that the office personnel may keep a complete check of progress, charts are posted for ready reference (Figs. 1, 2, 3, 4). Individual quarterly accounts are coded; e.g., 4-235 is 235 Wenonah Avenue. Individual monthly accounts are also coded; e.g., S-189 is Account 189 on South Side and 37-540 is 540 Madison Street.

The monthly accounts require two code numbers since the meter books are arranged for proximity of stops.

Preliminary to the billing of accounts, a proof must be made of the open accounts in the control to be billed. At this time, also, the discount is forfeited on past due accounts, all of which is a machine operation. It

FIG. 5. Customer Ledgers—Cash Posting Machine

FIG. 6. Billing Machine

has been the policy of the Oak Park department to allow the discount on one quarterly bill or two monthly bills during the year when the bill is paid after the discount date.

After the meter books have been checked for low or high consumption and the investigation cards have been prepared, billing is ready to proceed. Ledger sheets are  $7\frac{1}{4} \times 11$  in. in trays (Fig. 5), and the billing operation is all done on a billing machine (Fig. 6), which reproduces the statement of the account on a ledger sheet, an original bill and stub, and a record on the journal sheet. The total accounts are divided into 23 controls, averaging about 500 accounts each, separated according to streets so that the amount open in each control is available at all times. Obviously the master control must be in balance with the total of the individual controls, thus showing the total amount of unpaid items. There are sufficient totalizers on the machine to provide, at the close of each day's billing, the amount of water billed, in 1,000 gal., the total gross, discount and net amounts due, arrears and total billing, all of which are recorded on the journal sheet. As a check against the day's work, the amount of water billed, in 1,000 gal., must equal, when the rates are applied, the total gross billing. Buff-colored ledger sheets are used for the quarterly accounts and blue for the monthly accounts. The monthly bills are also printed on blue paper stock.

On Mar. 1, 1936, the water rates were increased from \$1.75 to \$2.50 for a minimum quarterly bill allowing 9,000 gal., with step-down rates for higher consumption raised from 18¢ to 27¢ per 1,000 gal. on the first step. The incentive for the prompt payment of bills was changed from a penalty

basis to that providing a 10 per cent discount if paid within ten days.

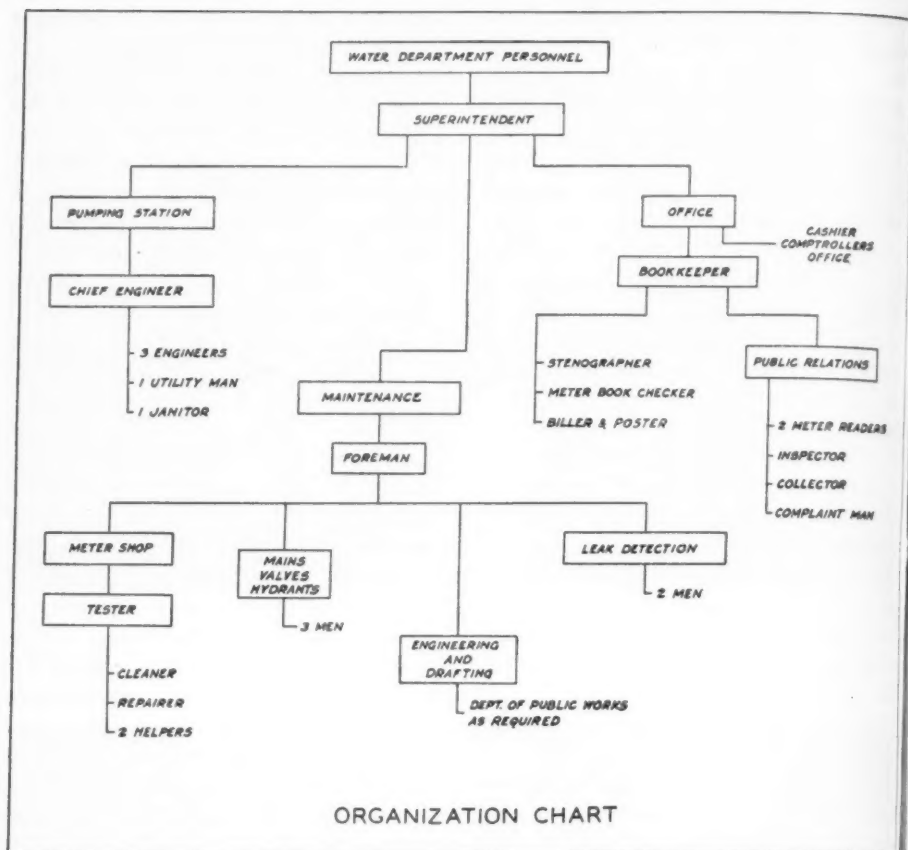

Early in 1937, it was decided to make a concerted effort to collect delinquent accounts. At that time one of the employees was made a collector and, through a systematic method of delinquency notification and follow-up, many bad accounts which had carried arrears for many years were gradually reduced and finally paid in full. Since the ordinances of the village provide that accounts become delinquent in 30 days, notices in triplicate are prepared. The first is a notification that the account is past due; the second, mailed after seven days, states that no further extension of time is allowed; the third copy is then given to the collector. He in turn calls for collection and has authority to leave a shut-off notice if payment is not forthcoming. It is gratifying to report that the need for discontinuing service for non-payment of bills is negligible.

The results obtained are probably more evident from a tabulation of accounts receivable and dead accounts charged off, as follows:

<i>Year</i>	<i>Accounts Receivable</i>	<i>Accounts Charged Off</i>
1936	\$59,758.59	
1937	46,617.94	
1938	39,961.07	\$1,635.67
1939	34,334.05	1,101.88
1940	34,067.26	696.58
1941	26,449.87	191.71
1942	23,621.71	10.95
1943	24,054.77	4.42
1944	25,411.86	Nothing

Many things have contributed to this record of collection. The first factor is a definite program of service to the customer in courteous attention to his complaints, notification to him of leaks on the premises and, if requested, a recording chart of the water consump-

tion on the premises during a 24-hour period. We believe that every customer should be water conscious to the extent that he feels he can use all the water he needs, but should not allow it to waste through leaking fixtures, underground piping or faulty refrigerating or air-conditioning equipment.

The second factor is a complete understanding with the governing officials of the village, the president and the

board of trustees, that the water department is disbursing a commodity which is accurately measured and delivered to the customer, to the end that special privileges will not be permitted.

The third factor is that a systematic program of control and collection of accounts, having been established, is followed without deviation, to the end that proper credit relations are fully recognized.

### Purchase of Surplus Property by Water Utilities

Surplus Property Administration Regulation 14 (issued on November 8) sets up special rules of procedure for various public agencies to obtain surplus materials at a discount of 40 per cent below the established "fair value." Publicly-owned water works properties are entitled to purchase under the special rules.

Details of the operation, however, have not been completely outlined. The U.S. Public Health Service is to establish a "Division of Surplus Property Utilization" which will clear all requests to purchase materials under the special discount terms. As soon as definite information is available concerning procedures, it will be brought to the attention of water works men.

In the meantime, every water works superintendent should ask the *nearest* office of the Reconstruction Finance Corporation or Department of Commerce to put his name on the mailing list, so that he will be informed concerning what is offered for sale in the line of his interest, inspect the material desired, if at all possible, and file notice with the disposal agency that purchase of the items under the special discount privilege is intended. Then, until further notice is received, the Surplus Property Utilization Division of the U.S.P.H.S. in Washington should be told just what is desired for purchase.

No further information is available at this time.

November 15, 1945

# Municipal Accounting

By Paul L. Sandberg

Deputy Auditor, City and County of Denver, Denver, Colo.

Presented on Sept. 1, 1945, at the Rocky Mountain Section Meeting, Denver, Colo.

THE subject of accounting, as handled in the Auditor's Office of the City and County of Denver, may be broken down into five sections, as follows:

1. Municipal Accounting Defined.
2. General Duties of the Auditor.
3. The Budget and Appropriations.
4. Summary of the Accounting System.
5. Results.

## Municipal Accounting Defined

In the revised edition of the book published by the Municipal Finance Officers Association entitled *Municipal Accounting Statements*, prepared by the National Committee on Municipal Accounting, is given a very clear definition of municipal accounting, which is quoted in part as follows:

A municipality's accounting system must make it possible, among other things, to determine whether or not the municipality is administering its financial affairs in accordance with legal provisions. This result is partly attained through the establishment of funds.

**Fund Defined.** In municipal accounting, a fund is defined as a sum of money or other resources (gross or net) set aside for the purpose of carrying on specific activities or attaining certain objectives in accordance with special regulations, restrictions or limitations and constituting an independent fiscal and

accounting entity. Note that a fund is both a sum of resources and an independent fiscal and accounting entity. Each fund must be so accounted for that the identity of its resources and obligations, receipts and disbursements, and revenues and expenditures is continually maintained. These purposes are accomplished by providing a complete self-balancing set of accounts for each fund showing its assets, liabilities, reserves, surplus, revenues and expenditures. The identification of the assets on the records is, however, sufficient and no physical segregation is necessary; for example, from an accounting standpoint, it is not essential to have a separate bank account for the cash of each fund.

**Distinction Between Use of "Fund" in Commercial and Municipal Accounting.** It is interesting to contrast the use of "fund" here with its use in commercial accounting. In that field, the term designates primarily an earmarked sum of money or other resources. Frequently, no complete self-balancing group of accounts is provided for such a fund. Fund surplus is not shown separately but is included with the general surplus on the theory that the surplus of a fund is part of the surplus of the business, and fund income is, for the same reason, included with the total income of the business. In speaking of a fund, therefore, one must indicate whether he is using the term in the municipal or commercial accounting sense.

**Classification of Funds.** There are various legal bases for the establishment

of municipal funds. Some are set up pursuant to state statutes, others in accordance with municipal charter requirements, and still others in compliance with ordinance provisions. Sometimes, too, funds are created for purposes of financial administration only; for example, because a utility is presumed to be a self-supported enterprise, its finances should be accounted for in a separate fund, even if not required by law. Funds may thus be classified according to whether they are established for administrative purposes or pursuant to legal provisions, and if the latter, whether they are set up in compliance with statutes, charter or ordinances. Such a classification is important when the degree of freedom which the chief executive or the legislative body can exercise in the handling of funds is under consideration. At the same time, it must be remembered that legal funds may play an important part in proper financial administration.

Another classification takes into account both the sources of revenue or receipts and the types of activities which they finance. This classification is valuable from the standpoint of accounting, financial administration and uniform financial statistics; its value is further enhanced by the fact that it makes possible the preparation of statements to show compliance with legal provisions. On this basis, the Committee recommends the following classification of funds: General Fund, Special Revenue Funds, Working Capital Funds, Special Assessment Funds, Bond Funds, Sinking Funds, Trust and Agency Funds and Utility Funds. In addition, there are the general fixed assets and the general bonded debt of a municipality which are not included as parts of any fund but are each set up in a separate self-balancing group of accounts.

*Brief Description of Each Type of Fund.* The General Fund accounts for all revenues and the activities by them, which are not accounted for in some special fund.

Special Revenue Funds are established

to account for taxes and other revenues set aside for a particular purpose. Usually a separate Special Revenue Fund is set up for each purpose for which the revenues are dedicated; for example, if a special tax levy is made for schools, a Special Revenue Fund is set up to account for the school's finances.

Working Capital Funds are used to account for the financing of activities of a manufacturing or service nature such as the operation of an asphalt plant or a central garage.

Special Assessment Funds account for special assessments levied to finance improvements or services deemed to benefit the properties against which the assessments are levied.

Bond Funds are used to account for the proceeds of bond issues.

Sinking Funds are set up to account for the accumulation of resources for retiring term bonds at their maturity.

The purposes of Trust Funds and Agency Funds are to account for cash or other assets held by the municipality as a trustee or agent, respectively. The two classes of funds are so similar that for accounting purposes they are grouped together.

Utility Funds are established to account for the financing of services rendered primarily to the general public for compensation, such as those of water works, electric plants, docks and wharves.

General fixed assets are all fixed assets other than those carried in a Working Capital Fund or a Utility Fund and general bonds are all bonds not payable either from a Special Assessment Fund or a Utility Fund and which are therefore not shown as part of those funds.

*General Characteristics of These Funds.* The above represent the maximum number of types of funds which a municipality may require. Many will need only a few of them; for instance, if a city does not operate a utility, it will have no need for a Utility Fund. A municipality may, however, have several related funds; for instance it may have many Special Revenue Funds or Special Assessment Funds.

### General Duties of the Auditor

*An outline of the procedures which are effective in the City and County of Denver follows:*

The auditor shall be the general accountant of the city and county. He shall receive and preserve in his office all accounts, books, vouchers, documents and papers relating to the accounts and contracts of the city and county, its debts, revenues and other fiscal affairs not required to be kept by the clerk, and, except as otherwise provided in this charter, or by ordinance, prescribe the mode of keeping, dating and rendering all accounts. He shall provide and keep in his office tables of the finances, assets and liabilities of the city and county, and keep all contracts, names of contractors and names of employees in such manner as to show the department in which they are employed, their respective salaries, powers, duties and method of appointment. He shall require all claims, settlements, returns and reports made to him to be verified. He shall give information as to the exact condition of the treasury, and of every appropriation and fund thereof, upon demand of the mayor, council or any committee thereof.

He shall sign all warrants, countersign and register all contracts, keep a true and accurate account of revenues, receipts and expenditures of the city and county, and each of the different funds thereof, furnishing to each department monthly a statement of the unexpended appropriation of that department; see that rules and regulations are prescribed and observed in relation to accounts, settlements and reports; that no appropriation of funds is overdrawn or misapplied, and that no liability is incurred, money disbursed, or the property of the city and county

disposed of contrary to law or ordinance, and shall perform such other duties not inconsistent with the provisions of this charter, as the council may by ordinance require.

He shall keep an official record of all demands audited by him, showing the number, date, amount, name of the original holder, on what account allowed, against what appropriation drawn, out of what fund payable, and by what officer or department previously approved; and he shall allow no demand unless the same has been approved by every department, commission or officer required to act thereon.

He shall keep a register of warrants showing the funds upon which they are drawn, the number, in whose favor, for what services and the appropriation applicable to the payment thereof.

Every demand upon the treasurer, except the salaries of the auditor and his employees, shall, before payment, be presented to the auditor, who shall determine that the money is legally due, its payment authorized against what appropriation and out of what fund it is payable. If he allows it, he shall endorse upon it the word "allowed" with the name of the fund out of which it is payable, affix the date of allowance and sign his name thereto; if he does not allow it, he shall endorse upon it the word "rejected." No demand shall be approved or paid unless presented as required by his charter.

The auditor shall make a verified statement to the council showing receipts and disbursements and the condition of each fund at the close of business on June 30, and shall also make and transmit to the council on or before January 15 a verified report of the financial transactions of the city and county during the preceding year.

## **The Budget and Appropriations**

On or before the first Monday of November in each year the heads of the various departments, offices and commissions of the city and county shall furnish the mayor an estimate in writing of the probable expense to be incurred in their several departments for the ensuing fiscal year, specifying in detail such probable expenditures, including a statement of the salaries of their subordinates. Duplicates of these estimates shall be sent at the same time to the auditor.

The auditor shall, at the same time, also certify to the mayor the amount of money to be raised by taxation to pay the interest on bonded indebtedness, and to provide for the sinking fund.

On or before the first Monday of December in each year the mayor shall present to the council a detailed statement of the amount necessary to defray the expenses of the city and county government, and of each department thereof, for the ensuing fiscal year, stating also the amount to be raised by taxation to pay interest on bonded indebtedness, and to provide for the sinking fund.

The council shall meet in joint session annually between the first and third Mondays in December, and by vote of the majority of the members thereof make a budget of the estimated amounts required to pay the expenses of conducting the public business for the next ensuing fiscal year, based on the mayor's budget, and for the other purpose required by this charter. The budget shall be prepared in such details as to the aggregate sum and the items thereof allowed to each department, office or commission as the council shall deem advisable, subject to limitations in the charter, but the council shall not

change any item in nor the total of the mayor's estimate, except upon a vote of two-thirds of each body thereof.

After the final estimate is made in accordance with this procedure, it shall be signed by the mayor and clerk and filed in the office of the auditor. The several sums shall then be appropriated by ordinance for the ensuing fiscal year to the several purposes and departments therein named. The total amount appropriated shall in no case exceed 90 per cent of the amount of money to be received during the year by taxation, estimated upon the assessor's valuation and the tax levy, and from other sources of revenue.

The amount required to pay the interest on bonded indebtedness and provide for the sinking fund shall always be provided for out of the tax on property.

## **Summary of the Accounting System**

### *Budget and Appropriation*

The budget is prepared by the mayor and approved and passed by the city council. A copy is given to the auditor from which a journal entry is made to the general ledger and in detail to the appropriation incumbrance ledger under each department. Any purchase orders that are unpaid at the end of the year are reserved out of that year's appropriation balance and carried over to the ensuing year, which adds to the appropriation. The purchase orders are set up at once against this reserve and incumber the appropriation for such amounts. Additional appropriations and transfers from one department to another are made by ordinance.

### *Revenue*

All revenues are collected by the city treasurer and reported to the auditor

by a daily report and receipts attached. The receipts are checked against the report as to receipt number, revenue code number and amount, and notations are made as to revenue classification to which credits are to be made, as to general fund, and appropriation credits. It is then posted by machine to the revenue ledger according to revenue code classification. This ledger shows the daily posting, the total for the month and the total to date. At the end of the month tapes are made from the various classifications and entered in the cash analysis record from which journal entries are made to the general ledger.

The reports are filed in a binder. The receipts are filed numerically in the auditor's office; both reports and receipts are kept indefinitely. Each department that collects any money, licenses, fees, etc., makes its own report to the treasurer in three copies. The treasurer in turn issues a receipt for same to the department and enters the receipt number on all three copies. The treasurer retains the white copy, the department depositing the money delivers the yellow copy to the auditor and the blue copy is retained by the department. The auditor then checks this yellow copy against the treasurer's daily report of cash receipts. After this has been done the postings are made to the revenue ledger direct from the auditor's copy. With this system the total of any revenue items may be determined at any time.

The county treasurer collects all taxes which are distributed by apportionment to the city and county, state and school district each month. The auditor receives a report from the county treasurer for the month. This report is entered in the tax ledger and a journal entry made from that to the

general ledger crediting each fund with its share.

### *Purchase Orders*

A request is made to the head of the department for supplies needed and he in turn makes out a requisition to the purchasing department.

The requisitions are issued in duplicate by the department head with the department name, number and date. The original copy is sent to the purchasing department. The duplicate copy is retained by the department issuing the requisition.

Purchase orders are then issued from these requisitions by the purchasing department. Quotations are requested as provided and are submitted in the regular manner of purchasing routine.

The purchase orders are issued by the purchasing department in five copies and are sent to the following:

Original and duplicate to vendor.

Third copy to auditor.

Fourth copy retained by purchasing department.

Fifth copy to department originating requisition.

### *Purchase Order Register*

The purchase order register is made in duplicate in the office of the purchasing department on loose-leaf sheets and is filed in a loose-leaf binder.

The original copy, with the auditor's copy of the purchase orders attached, is sent to the auditor's office daily. The auditor compares the purchase orders with the register and checks prices and extensions thereon and adds the register sheet and purchase orders on adding machines, retaining the tape for the predetermined total. The total of each must balance.

The purchase orders, together with adding machine tape, are in turn given

to the machine operator and posted on the credit side of the vendor's ledger, which provides a complete record of all purchase orders with each vendor, enabling the auditor to account for all commitments made. The purchase orders are posted alphabetically as a credit, showing number, department, appropriation number and amount. After posting and proving with the purchase order register, they are passed on for the appropriation incumbrance and expenditure ledger.

#### *Appropriation Incumbrance and Expenditure Ledger*

The purchase orders are then assorted in numerical order by departments and posted as to purchase order number, date and amount. A proof of the work is obtained and verified with the pre-determined total of the purchase orders as listed from tape of purchase orders and as posted to the vendor's ledger. The total amount posted is carried to the control of the appropriation incumbrance and expenditure ledger, which shows the total to date.

The purchase orders are then filed by departments. As the purchase orders are paid they are taken from the file. Those remaining should balance with the unpaid orders and contracts at the end of each month, as shown on vendor's ledger and appropriation incumbrance and expenditure ledger. Purchase orders are kept for a period of one year or more.

#### *Vouchers*

Vouchers are sent in triplicate by the purchasing department to the vendor to fill in statement of account, attach original purchase order, sign oath of claimant and return to the purchasing department.

The purchasing department then checks the vouchers against the purchase order register as to amount, purchase order number and name and sends them to the department making the purchase for signature (A), person receiving goods and (C), head of the department approving voucher for payment. They are then returned to the purchasing department to certify price with approved requisition (B), and sent to the auditor where they are stamped off by date received in purchase order register, audited by accountant showing adjustments, approved, dated and submitted to the auditor for final approvement for payment. They are then arranged according to departments. The purchase order, two copies of voucher, pink and yellow, are numbered to correspond with the number of the warrant to be issued, and listed on the warrant register. This is a loose-leaf record which shows the department, date, vendor's name, warrant number, amount, signature of party receiving warrant and date paid by treasurer.

The machine on which the warrant register sheet is written is equipped with a totalizer which registers the amount of vouchers entered. This total is given with the vouchers to the operator of the check writing machine.

Warrants are issued in settlement of a purchase order or for employees' services on a payroll. Where work is being done under terms of a contract registered and countersigned by the auditor, requisitions and purchase orders are not necessary. Each warrant shows the department or fund drawn upon, to whom payable, amount and purchase order number or for service. Warrants are written upon a check writing machine, equipped with totalizer, thus giving the total of warrants to check

with total on warrant registered or payroll. These must balance.

A notation is made of the amounts and numbers and this notation with the vouchers given machine operators who enter them on the appropriation incumbrance and expenditure ledger which shows amount of payments issued against departments, showing purchase order number, date, voucher number and amount. Vouchers having adjustments or changes in the original amount of purchase orders are also posted on the appropriation incumbrance ledger, thereby making the vouchers and purchase orders agree. The vouchers are then re-assorted alphabetically and posted as a charge on the vendor's ledger, giving date, purchase order number, warrant number, amount and adjustments. The total must check with that posted on appropriation incumbrance and expenditure ledger. The balance as shown on the vendor's ledger sheet represents the unpaid contracts, or the amount owing the vendor. After each run of vouchers the total is posted on the control; the difference between the total debits and credits shows the total outstanding purchase orders, which agrees with the unpaid purchase orders as shown on the appropriation incumbrance and expenditure ledger. This is checked at the end of each month with the appropriation incumbrance and expenditure ledger as to purchase order number and amount. Those unchecked on the incumbrance ledger indicate the unpaid incumbrances against the appropriation. Both the appropriation and vendor's ledgers are reconciled with total of unpaid purchase orders on file.

#### *Expense Recapitulation*

An expense recapitulation, designed to complete in one operation the dis-

tribution of expense for each appropriation account, is made monthly. This is made direct from the vouchers by departments to separate expense ledger sheets as to expense code, such as "A-1" Supervision; "B-1" Stationery and Office Supplies, etc., showing month, amount and total to date; thus giving an itemized statement of expenditures to date. The expense recapitulation is balanced with the total of all disbursements. The compilation of departmental annual reports and the detail for budget estimates is available from proven figures at all times.

The analysis of disbursements for warrants, coupons and bonds, issued and redeemed, is made monthly from daily reports. From this analysis the journal entries are made and posted to the general ledger.

#### *Warrants*

Warrants are sent to the department issuing requisition or payroll for countersignature after which the register is completed for voucher warrants, with the date returned from the department and number and payroll warrants checked with the payroll. The auditor's signature is affixed and the warrants are ready for delivery to the vendor or employee.

If the warrant is called for by vendor or agent the register is signed; if mailed, a numbered remittance slip is written, giving number of warrant, department and amount. This number is entered on the register and the duplicate slip filed. Payroll warrants are signed for by employee drawing same.

This total is also entered in the warrant issued book daily by date, first and last warrant number and carried for the month, then entered in the analysis of disbursements and journal entry made to general ledger.

### *Payrolls*

Payrolls are prepared in duplicate in the departments. The original copy is forwarded to the auditor's office and the other is retained by the department. The name, title and rate are compared with a certified list; extended, calculated, audited and allowed by the auditor. Payrolls are numbered to correspond with warrant numbers. A different series of numbers and colors are used on payroll warrants to distinguish them from voucher warrants.

At close of each payroll period a recapitulation is made for each payroll showing the expense distribution, which is posted to the expense and appropriation ledgers. This recapitulation also shows the number of employees.

### *Report of Canceled Warrants*

This report is made in the office of the city treasurer in triplicate; the original and two duplicates. Canceled warrants and two copies of the report are delivered to the auditor's office daily. The warrants are checked with the report and for endorsements, stamped off the register of warrants drawn and payrolls, showing date paid by the treasurer.

This report is entered daily in the warrant redeemed book by funds. At the end of the month the various totals are entered in the analysis of disbursements and from that a journal entry is made to the general ledger.

At the end of the month the warrants not stamped off are shown as outstanding and are carried on the auditor's records until such time as they are presented for payment. The amount outstanding is reconciled with the balance of warrants payable account on the general ledger.

Bonds and coupons are redeemed by the treasurer and paid for by cash and charged to the various funds. There are no warrants issued for the redemption of bonds and coupons. Payment of bonds and interest coupons are the *only* disbursements authorized by law to be made otherwise than by auditor's warrant.

The treasurer issues a report to the auditor with the canceled bonds and coupons which are checked with the report and also checked with the bond register as to date and amount. All canceled warrants, bonds and coupons, after being checked by the auditor, are sent to the city clerk for filing.

### *Public Library*

The only exception in the conduct of the public library account is that this department issues its own purchase orders and does its own purchasing.

### *Board of Water Commissioners*

This department is operated the same as the city and county except it has its own purchasing agent, writes its own payroll warrants, which are checked and signed by the auditor. A sub-ledger and general ledger are carried separate from the city and county in the auditor's office. Purchase orders and vouchers are the same as for the city and county.

### *Controls*

The general controls govern the departmental and detail accounts and complete the final posting operation. The controls should be in balance daily. Reports are compiled from the general ledger, revenue ledger, appropriation incumbrance and expenditure ledger, appropriation warrant issued ledger and redeemed warrant book and cash

and disbursement analysis which are the auditor's statement of appropriation funds, auditor's revenue statement, auditor's statement of available cash and auditor's annual report.

The statement of available cash and statement of appropriation funds and revenue statement are completed promptly. This information is available each month for comparative purposes and as a guide toward determining future appropriations.

### Results

The results may be summarized as follows:

All accounts are in balance daily, affording an immediate opportunity to take up any question about an account with a department head or vendor.

There is satisfaction in knowing that the balances and totals are always

proved figures. This information is available when needed.

The department controls and expense recapitulation reflect an analysis of cost by departments, subdivided by twelve group classifications, which in turn are subdivided into from 1 to 39 sub-accounts, enabling the use of a complete cost basis with which to analyze appropriation estimates in the budget.

The revenue accounts are detailed under nine groups.

The control of the budget and appropriations commences with the beginning of the year instead of delaying until the completion of the previous year's reports, thereby insuring the continuous uninterrupted control so necessary to regulate the problem properly.

## Sales Engineers' Viewpoint on Tendering for Water Works Equipment

*By William Storrie*

Cons. Engr., Toronto, Ont.

Presented on Mar. 20, 1945, at the Canadian Section Meeting, Toronto, Ont.

IN an effort to secure the viewpoint of sales engineers and contractors on tendering for plans and specifications prepared by municipal and consulting engineers, a round table discussion, under the chairmanship of the author, was held at the last meeting of the Canadian Section. The object in view was to give those tendering on municipal works an opportunity of stating frankly what they thought of certain clauses in the usual form of specifications and tenders. It was hoped that the discussion would be wide open and result in the establishment of a more standardized form of tendering than exists at the present.

Unfortunately those asked to participate in the discussion proved somewhat reticent in expressing their views. The questions asked and the answers obtained are given in the following statements, which have been supplemented to a considerable extent by the author's own opinions.

*Question 1. Are engineers justified in asking tenderers to deposit a sum of money for the loan of plans and specifications to enable a tender to be submitted*

(a) *When the sum deposited is refunded to tenderers when plans and specifications are returned?*

(b) *When the sum deposited is not returned to tenderers?*

The consensus of opinion indicated that all tenderers should be called upon to deposit a sum of money at the time the plans and specifications were taken out for tendering but that this sum should be refunded to the tenderer once the plans and specifications have been returned in good order.

*Question 2. Should a tender bond be accepted in place of a marked check when a tender is submitted?*

Tender bonds should not be accepted on the ground that in many cases bonding companies are often asked at the last moment to furnish a bond to enable a tenderer to submit a tender without having an opportunity to ascertain the financial standing of the tenderer. Rather than turn down the prospect of being asked later on to furnish a contract bond the bonding company would issue the tender bond, which afforded small protection. This condition usually arises in the case of smaller contracts.

*Question 3. Should a contractor be allowed to deposit a sum in cash or money bonds satisfactory to the municipal treasurer in place of a surety or performance bond usually provided by a recognized guarantee bonding company authorized by law to carry on business in Canada?*

The answer is yes.

*Question 4. Should an "unbalanced" itemized tender be rejected?*

The answer is yes. A case was cited where an itemized tender amounted to \$1,000,000 in which all items carried out in the initial stages of the construction work were priced so high and the later items so low that when about one-third of the actual work was completed the estimate would indicate, at the unit prices stated, that two-thirds of the contract sum had been completed. This enabled the contractor to finance the whole contract based on the excessive payments made during the early stages of the construction work. This also produces a dangerous possibility if the contractor is financially unsound and he finds that money would be lost in the contract if he completed same.

*Question 5. Should the municipality be held responsible for payment of materials when contracts are awarded to construction companies, which includes the furnishing of all such materials by the contractor?*

The answer to this question is no. The general practice, however, appears to be that in water main contracts the municipality purchases the pipes, special castings, valves and hydrants and furnishes same to the contractor employed for excavating the trench and laying the mains.

*Question 6. Should tender forms stipulate that material be delivered on the job; for instance, in the case of water main pipe, should the suppliers' price include delivery strung along the trench wherever possible, or merely F.O.B. truck at site of construction?*

The answer to this depends entirely on the local conditions. If the location of the water main is within trucking

distance from the foundry then the pipe should be strung out along the trench by the contractor furnishing and delivering the pipe. If the location of the main is such that the pipe has to be delivered from the foundry by freight train then the contractor supplying the pipe should not be called upon to transport the pipe from the freight car to the site. It was emphasized, however, that under such type of contract the delivery of the materials should be arranged so as to keep just ahead of the laying of same, thus avoiding the danger of contamination and possible deterioration of the materials when left lying on the ground for some considerable period ahead of the laying of the mains.

*Question 7. Can tendering on equipment by sales engineers be likened to a game of poker?*

This question brought out a considerable amount of discussion which is summarized as follows:

There used to be a saying that it was the successful tenderer who lost the money. The equipment distributor, through his sales engineer, spends considerable time, money and effort in compiling for the municipal and consulting engineers general information concerning prices, weights, dimensions, characteristics, etc. Then the engineer draws up his specifications from the information supplied and incorporates them in a general contract, which makes it necessary for the sales engineer to start all over again and go over the requirements with the tenderers submitting their prices to the general contractor. Often such information has to be supplied to many tenderers. After the general contract has been awarded the sales engineer has to make another start with the general

contractor due to his playing the equipment distributors one against the other, thus making it like a game of poker. Finally the distributors fall out one at a time and the one who whittles his price the most gets the order, but there is nothing left in it for him.

It was the opinion that the equipment distributor should not have to tender to the contractor but direct to the utility or user. Tendering on this basis would still be competitive, but the distributor would have the satisfaction of knowing that his offer was being considered by the users who would classify and consider the tenders from the angles of first cost, suitability, reputation and service. The results would be a reasonable return to the equipment distributor for services rendered, a better job for the user of the equipment and a tendency to keep the general contractor confined to his own business.

Some of the equipment distributors did not agree with the above but the consensus of opinion appears to be that there was room for improvement in calling for tenders for equipment.

*Question 8. As a general practice should tenders for equipment be advertised?*

The answer to this question depends entirely on the circumstances. If tenders are called for some particular type of equipment, and it is known that only two firms can produce it, there would be no point in advertising.

The general policy appears to be that with some exceptions the calling for tenders should be advertised.

*Question 9. Should bids be considered if alternates are included proposing the furnishing of materials other than those included in the specifications?*

Unless specifically stated it was generally felt that tenders including alternates for furnishing certain materials and equipment should be allowed.

*Question 10. Should contractors be required to stipulate completion date on job bids and be forced to accept a penalty for non-compliance?*

Tenderers should be called upon to state the time of completion in their tender form. Court decisions in certain parts of Canada indicate that if a penalty is provided for non-completion within the time stipulated in the contract this can only be done by offering a bonus for completion ahead of the stipulated contract time.

*Question 11. Should contractors be given assurance in the conditions surrounding specifications that the contract will be awarded to the lowest bidder providing he can prove financial responsibility?*

In municipal work whether or not a contractor is financially sound the engineer is called upon to let anyone take out plans and specifications who desires same. Financial responsibility is not the only guiding factor in determining who should be awarded the contract. If an engineer's experience with a particular tenderer is such that he cannot recommend the acceptance of such a tender, then he is justified in recommending against it. Under such conditions the engineer should not be called upon to state in his specifications that "The contract will be awarded to the lowest bidder, providing he can prove financial responsibility."

The specifications usually state that the municipality reserves the right to accept the lowest of any tender or reject all tenders.

*Question 12. Should a contractor be expected to place on his payroll an inspector working for the interests of the engineer for the duration of a specific job?*

The principle involved in such an arrangement should not be countenanced for one moment. The inspector on the work is employed to see that the plans and specifications prepared by the engineer are carried out and an inspector under those conditions should not be paid by the contractor.

It is admissible to insert a clause in the contract to the effect that, if the contractor fails to complete the work within the time stipulated in his contract, he will have deducted from his final contract sum the cost of providing an inspector over the period beyond which the contractor undertook to complete the work. In this case there is no transference of money between the contractor and the inspector.

*Question 13. Should the specifications clearly stipulate that no extras will be allowed on the job?*

If it is stipulated that no extras will be allowed on the contract the engineer in reality is calling upon the contractor to guarantee the engineer's specifications and possibly the quantities. Few contracts are completed without some unforeseen circumstances arising.

*Question 14. Should the engineer clearly stipulate what constitutes "rock"?*

It was felt that as far as possible the term "rock" should be defined. In some specifications excavation is defined as including all types of material that may be encountered and the contractor is in such a case called upon to make such investigations as he can before submitting his tender concerning the nature of the material to be excavated. Rock is a hard material to define but every effort should be made to make clear what the intention of the specifications is regarding the material to be excavated.

*Question 15. Should contractors be expected to maintain a system or an extension to a system for a period of one year after completion of a specific project?*

The opinion on this question seems to be somewhat divided. Contractors should be called upon to guarantee the workmanship for a period of six months, one year or even longer, depending on the nature of the contract. A contractor, however, should not be called upon to maintain the system from any defect that may arise when it can be shown that same is not in any way due to his work. For instance, if an obstruction appears in a sewer, because some material has entered same, and is not in any way a result of the construction work, then the contractor should not be called upon to remove such obstruction at his own expense.

## Taxation of Municipal Utilities

### *Abstract of Ohio Supreme Court Decision No. 30128*

**B**Y a five (Weygandt, Turner, Hart, Matthias and Bell) to two (Zimmerman and Williams) decision, the Supreme Court of Ohio, in June 1945, ruled that the real and personal property of the city of Cleveland, Division of Municipal Transportation, was not exempt from taxation.

Subsequent to this decision Ohio County Auditors have been asked to appraise and place upon the tax duplicate the property of the various municipally-owned and -operated water supply systems. The far-reaching import of this decision on water supply systems (and possibly sewage disposal systems under Sewer Rental Law Operation) makes it imperative for those interested in the management of water supply and sewage disposal to give careful thought thereto.

The case came to the Supreme Court on appeal by the Cuyahoga County Auditor and the Cleveland City School District from the Board of Tax Appeal's conclusion that the property of the Cleveland Traction System was exempted from taxation upon the authority of *City of Toledo v. Jenkins et al.*, Board of Tax Appeals, 143 Ohio St., 141.

The syllabus states:

Municipally-owned real estate used in private or proprietary function—General Assembly without constitutional Authority to exempt same from taxation—Municipality forfeits immunity from taxation upon entering private competitive business—Personal property used for municipally-owned private competitive business, not exempt. . . .

### **Majority Decision**

*A paraphrase of the majority decision written by Judge Bell follows:*

This public utility was purchased by the city of Cleveland. The money required was derived from the sale of mortgage revenue bonds.

The city owns and uses in the operation of its transit system both real and personal property. Therefore, two separate and distinct questions must be determined: (1) Did the General Assembly possess authority to pass general laws to exempt from taxation the real estate here in question? (2) Did the General Assembly, by the provisions of Secs. 5351 and 5356, General Code, exempt from taxation the personal property here involved?

The power of the General Assembly to pass general laws to exempt real property from taxation is limited by the provisions of Sec. 2, Article XII, of the Constitution; as to personal property, the power of the General Assembly to pass general laws to exempt such property is limited only by Article I of the Constitution.

Sec. 2 of Article XII amended by a vote of the people, effective Jan. 1, 1934, to read in part as follows:

" . . . general laws may be passed to exempt public property used *exclusively* for any public purpose. . . ."

The language of Sec. 2 of Article XII is not a grant of power to the General Assembly but is a limitation upon the general power of that body to grant tax exemption to real property only.

The constitutional provision relative to exemption of real property from taxation is neither self-executing nor mandatory and in the absence of legislative action all property of the state and its political subdivisions, no matter how used, would be subject to taxation.

What is meant by the phrase used in Sec. 2, Article XII, "general laws may be passed to exempt . . . *public property used exclusively for any public purpose*"?

It is generally recognized that the powers and functions of municipal corporations are divided into two classes: (1) public or governmental, and (2) private or proprietary. It is equally well recognized that municipally-owned property used in carrying on a private or proprietary function *for profit* is usually required to contribute its proportionate share of the cost of government.

In 37 Cyc., 877, the rule is stated thus:

There is no implied exemption from taxation of property owned by a municipal corporation, but which is not devoted to public or governmental uses, but held by the municipality in its private or commercial capacity and *as a source of profit or to serve some mere convenience of the citizens*.

By the language, "used exclusively for any public purpose," we feel quite sure it is not intended that public property held and used for a purely private purpose and for private gain should be granted exemption from taxation. This conclusion is fortified by the language found in a unanimous decision of this court, wherein it is said:

The description of municipal property which is exempt from taxation indicates with unmistakable accuracy that the exemption is to extend to such property

only as is actually employed in the exercise of municipal functions. If this conclusion were doubtful it would nevertheless be required by the established rule that all exemptions from taxation are to be strictly construed.

It must be admitted that there is considerable conflict among the authorities as to what is a governmental and what is a proprietary function. However, in the final analysis we must find the answer to our problem in the Ohio Constitution, as construed by the decisions of this court.

From what has been said in various decisions of this court we conclude that in the ownership and operation of a transit system a municipality is engaged in a private or proprietary function. If the general rule were applied that would make an end to this phase of the case, but in Ohio that general rule has not been always followed.

In the decisions of this court there has been no deviation from the conclusion that a municipality in the operation of a public utility is engaged in a proprietary and not a governmental function, yet light and power plants, *water works* and airports, when municipally owned and operated, have been held exempt from taxation. Therein lies the conflict between the general rule and the Ohio cases.

Judge Bell stated that, if this were a case of first impression, he would hold that the General Assembly is without power to exempt any public property (real property) from taxation unless such property is used exclusively for a governmental purpose; and that the ownership or operation of any public utility operated to preserve the peace or *for the protection of the person or property of the citizens* is the exercise of a governmental function and such property *could be exempted*

from taxation, while the ownership or operation by a municipality of a utility which relates only to the development of the municipality itself constitutes the exercise of a private or proprietary function and such property could not be exempt from taxation. Such holding would conform to the generally accepted rule.

There can be little doubt that where a municipality owns or operates such a system for the convenience of the public it is engaged in a private competitive business for profit, and, while such property is publicly owned, it is not used exclusively for a public purpose.

Public property used exclusively for any public purpose is exempt from taxation for two reasons: (1) it is purchased and maintained by public money derived from taxation and to tax such property would amount only to taking public money from one pocket and putting it into another, and (2) the product of the expenditure of tax money should not be made the subject of another tax.

The property here in question was not purchased with public money. The city is in no way liable for the payment of the mortgage revenue bonds or for the maintenance of the property. If the operation of the transit system should prove to be a losing venture the only recourse of the bondholders would be to sell the property and stand any resultant loss.

The great weight of authority is to the effect that where the state (or one of its political subdivisions) enters the field of *private competitive business for profit* it divests itself of its sovereignty pro tanto, takes on the character of a private corporation, and thereby forfeits its immunity from taxation.

It is a matter of common knowledge

that the city has collected sufficient revenue from the operation of the transit system, over and above operating expenses, to pay off almost half of the purchase price. We think that is cogent evidence that the city has entered the field of private competitive business *for profit*.

There is another test, which is often applied in order to determine whether publicly-owned or -operated property is being used in connection with a governmental or a proprietary function.

It is a settled rule of law that a municipality is not liable for negligence of its agents or servants while engaged in a governmental function but is liable if engaged in a proprietary function.

By all the applicable tests it must be concluded that the city entered the field of private competitive business *for profit*; that under such a state of facts, the General Assembly could not and therefore did not authorize tax exemption of the real property used in such enterprise.

The Board of Tax Appeals held that its decision was authorized by the case of *City of Toledo v. Jenkins et al., Board of Tax Appeals*. An examination fails to disclose any language which would warrant the conclusion that where a municipality enters the *field of private competitive business for profit*, the real property used in conducting such enterprise is exempt from taxation under any provision of the General Code. The distinction between the Toledo case and the instant case is that in the Toledo case the enterprise was not being conducted primarily for profit, while here the *primary and principal object* of the enterprise is *profit*.

The General Assembly is limited to grant tax immunity to personal property only by Article I of the Constitu-

tion. Do Secs. 5351 or 5356, General Code, grant such immunity to the personal property here in question? Sec. 5351, General Code, reads as follows:

... and public property used for a public purpose shall be exempt from taxation.

It should be brought to mind that exemptions from taxation are not favored by the law. He who claims tax exemption of property, real or personal, must show clear and indisputable authority for such exemption.

In this state the rule is applied without respect to the identity of the claimant.

The language of Sec. 5351, General Code, is general and can be applied to any property whether real or personal. However, that section was passed pursuant to Sec. 2, Article XII, of the Constitution, and is no broader than the constitutional provision upon which it is bottomed. *As applied to personal property it is provided that it must be public property used for a public purpose.* The public ownership and the public use must co-exist. Whether it is used for a public purpose is quite another matter. What has been said as to the use of the real property applies with equal force to the personal property used in connection with the operation of the transit system.

Sec. 5356, General Code, reads as follows:

Market houses, public squares or other public grounds of a city, village or township, houses or halls used exclusively for public purposes or erected by taxation for such purposes, notwithstanding that parts thereof may be lawfully leased, and property belonging to park districts, created pursuant to the provisions of Sec. 2976-1 et seq., of the General Code, shall be exempt from taxation.

We are at a loss to understand the claim that this section grants tax exemption to a municipally-owned transit system.

We conclude and hold (1) that under the Constitution the General Assembly could not and therefore did not pass any general law to exempt from taxation the real estate used in connection with the operation of this transit system, and (2) that, while under the Constitution the General Assembly could, it did not exempt from taxation the personal property so used.

### Dissenting Opinion

*The dissenting opinion of Judge Zimmerman sets forth the following:*

Sec. 4, Article XVIII of the Constitution of Ohio confers upon municipalities the right to "acquire . . . and operate . . . any public utility the product or service of which is or is to be supplied to the municipality or its inhabitants."

Sec. 2, Article XII of the Constitution recites in part that "general laws may be passed to exempt (from taxation) . . . public property used exclusively for any public purpose. . . ."

Pursuant to such express authorization, the General Assembly enacted Sec. 5351, General Code, declaring, inter alia, that "public property used for a public purpose shall be exempt from taxation."

The precise question to be resolved is whether property of the transit system of the city of Cleveland is "public property used exclusively for any public purpose."

There can be no doubt that property of a utility owned and operated by a municipality is public property (*City of Toledo v. Jenkins et al.*, *Board of Tax Appeals*) and, under the holdings of this court in the case just cited and

in the cases of *State, ex rel., v. City of Toledo*, and *City of Toledo v. Hosler, Treas.*, such transit system, devoted to the transportation of the citizens of Cleveland generally, is used exclusively for a public purpose.

The syllabus in the Hosler case, *supra*, is peculiarly applicable and reads:

Gas wells, pipelines, pumping stations and machinery owned by a municipal corporation and used by it for the conveyance of gas to be consumed by it and by its citizens generally, are used exclusively for a public purpose and are exempt from taxation.

In 51 American Jurisprudence, 554, Sec. 563, the following statement appears:

While a number of courts have taken the view that public utilities operated by a municipal corporation for compensation . . . are taxable, upon the theory that the implied exemption of publicly-owned property extends only to property used for governmental, and not merely for public, purposes, the majority rule is that property owned by a municipal corporation is exempt if it is devoted to public purposes, whether these purposes are governmental or primarily for the benefit of its own citizens and, accordingly, that municipally-owned power and light plants, and water works, gas works, transit systems, and other public utilities distributing commodities and services to the public for compensation, which are for a public, although not for a governmental, use are included within the meaning of statutes exempting the property of municipal subdivisions.

We submit that the quoted constitutional and statutory provisions relating to the exemption from taxation of public property publicly used, coupled with the cases cited, place Ohio on the side of the majority rule as outlined in the above excerpt from American

Jurisprudence. The term "public purpose" as contained in our constitutional and statutory provisions is not restricted to purely governmental enterprises, but embraces a wider field of public activity, including proprietary undertakings. Where there is public ownership and public use of a utility, as in this case, the property of such utility is exempt from taxation under our laws.

We take the position that the Constitution is a vehicle of life, intended to meet and to be applied to new conditions and circumstances as they may arise and which come fairly within the purview of the language used. 8 Ohio Jurisprudence, 128, Section 26.

While only incidentally part of the decision, the following from Page's Annotated Ohio General Code is of interest to those concerned with the management of Ohio municipal water supplies.

Sec. 5357. (Water works and pipelines.)

Works, machinery, pipelines and fixtures belonging to a city or village and used exclusively for conveying water to it, or for heating or lighting it, shall be exempt from taxation. (R.S. Sec. 2732.)

See notes to G.C. 5349.

In *State, ex rel., v. Toledo* (48 O.S. 112, 26 N.E. 1061, 11 L.R.A. 729), the supplying of natural gas to a municipal corporation and its citizens was held to be a public use for which the taxing power might be exercised.

Gas wells, pipelines, pumping stations and machinery owned by a municipal corporation and used by it for the conveyance of gas to be consumed by it and by its citizens generally, are used exclusively for a public purpose and are exempt from taxation: *Toledo v. Hosler* (54 O.S. 418) reversing *Toledo v. Hosler* (10 O.C.C. 257, 6 O.C.D. 590); see, to the same effect, *Toledo v. Yeager* (8 O.C.C. 318, 6 O.C.D. 273).

# Water Works Industry's Attitude on Grounding and Stray Current Problems

*By Charles F. Meyerherm*

A.W.W.A. Representative on Article 250 Com., National Electrical Code

A contribution to the Journal

EVER since protective grounding of electrical systems on water pipes was advocated as a safety measure the American Water Works Association has attempted to co-operate with those supporting the practice, so long as damage to water pipes or water quality did not occur. The Association's initial sanction of water pipe grounding in 1920 was predicated on the assurance that the grounding connections installed for protective purposes would transmit stray currents to the water pipes only during the comparatively short and infrequent periods when these connections were fulfilling their protective functions. Ever since it became evident that this assumption was incorrect, and that with a multi-grounded electrical distribution system most of the grounding connections can and usually do transmit appreciable stray current to the water pipes more or less continuously during normal operating conditions, there has been a tendency among certain electrical interests to assert the propriety of increasing the stray currents on the water pipes, not in the interest of increased safety, but primarily to cheapen electrical installation costs and to simplify certain problems arising from the use of electric current or from the equipment and devices conventionally installed or advocated for approval and

use in the electric utility field. This tendency conflicts sharply with the water works industry's opinion that:

1. The National Electrical Code is primarily a safety code for life and property.

2. It is not a specification of calculated risks which insurance interests can profitably take.

3. The use of insulated conductors on the load side of service entrance equipment has not imposed any noticeable restriction on the use of electricity, nor on the development of the electric industry in this country.

At each revision of the National Electrical Code, in one Article Committee and then in another, attempts have been made to extend the use of bare neutral wiring or to destroy the effectiveness of the insulation on the grounded circuit conductor on the load side of the electric service equipment by connecting the frames of ranges, water heaters and other equipment to this conductor. Water works specialists see only increased hazard, not increased safety, in these proposed changes, and in their opinion the possible saving in electrical installation cost is insignificant compared to the hazards and complications introduced. They therefore feel that there must be some other explanation for the vigor, zeal and persistence with which the

advocates of these proposals carry on year after year. They suspect that the ultimate goal of this activity is a one-wire wiring system with the conductivity of water and gas pipes and other building metal work appropriated for electrical purposes, without regard to the responsibilities, hazards, complications and possible deleterious effects which such use of the pipes may entail.

From 1920, when water pipe grounds were first sanctioned, until about 1928, water works men did not know what rules governed this practice until the various editions of the Code were issued in final printed form. From 1928 to date, the water works industry has had only a special membership in the grounding subcommittee and in the Special Committee on Bare Neutral which was terminated years ago, but has had no representation on any other Article Committee and no vote in the Electrical Committee.

The A.W.W.A. on several occasions has called the attention of the Electrical Committee, as well as the National Fire Protection Association, to the impropriety of that committee's preparation of standards of electrical wiring which involved the use of the water pipe system for grounding and, incidentally, current-carrying purposes without the knowledge and consent of the owners of those pipes or of the water purveyors, who are charged with the responsibility of furnishing a continuous and safe supply of potable water through those pipes.

The A.W.W.A. has requested representation on the Electrical Committee and this request has been denied. The Association has not deemed it necessary to argue the matter, because

the reasonableness of the request and the unreasonableness of its rejection are self-evident. It is not surprising, therefore, that the water works industry views with suspicion the continued effort to write into the Code practices and policies which appropriate non-electrical structures for electrical purposes without the knowledge and consent of the owners and users of such structures.

Realizing what happened after the protective grounding of lighting transformers on water pipes was sanctioned, water works operators fear the implications and complications which may be involved in some of the proposed changes to the National Electrical Code, and they resent the necessity of having to defend continuously their objections to proposals which admittedly mean increased stray currents on water pipes. They maintain that until it can be proven to the satisfaction of the water works operators that such stray currents cannot possibly cause hazard or harmful effects to the water pipe system or to the water carried therein they should not be expected even to consider proposals which increase stray currents on water pipes.

The position of the A.W.W.A. with regard to electric grounding was correctly recorded by the members of the Board of Directors, after their annual meeting in New York in January 1944, and published in the March 1944 JOURNAL. The position thus recorded has not changed.

---

*The foregoing address was presented at the Eastern Section of the International Association of Electrical Inspectors on Oct. 22, 1945, in New York City.*

# Maintenance Problems

By A. A. Ulrich

Vice-Pres. & Mgr., Massillon Div., Ohio Water Service Co., Massillon, Ohio

Presented on Oct. 26, 1945, at the Ohio Section Regional Meeting, Massillon, Ohio

THIS paper deals with a number of maintenance problems which those who are charged with the responsibility of operating a water plant have had to correct at one time or another. These are actual maintenance problems encountered at Massillon, Ohio, and it is hoped that the suggestions here will benefit operators with similar problems elsewhere.

## Rehabilitation of Gravel Well

The water supply for Massillon is taken from twelve 6-in. rock wells and two gravel wells. Like most water departments, Massillon has been operating at near peak capacity during the past several years. The department has never had to restrict the use of water but it was found necessary, in order to meet the increased demand, to rehabilitate one of the gravel wells drilled in 1919. The capacity of this well had dropped from 3 to 1.4 mgd. Drawdown records showed that the trouble was not in the ground water supply but was due to a clogged screen, to corrosive elements or to silt and sand packing around the screen, thereby retarding the flow to and through the well screen. In the past, this well had been treated with acid on three occasions and once with dry ice, but without any real success. It was decided to replace the 24-year-old 12-in. screen with a new one. The work was planned for the winter, the season of low de-

mand. Construction was begun in December 1942 by inserting an 8-in. pipe into the well and sanding this into the 12-in. screen. The 8-in. pipe was then pulled, removing the old 12-in. screen with it. The pipe was extended to the bottom of the well, at a depth of 153 ft., and the bottom 10 ft. were sanded tight. The sanding was accomplished by wrapping burlap sacks around the bottom of the first section of pipe to fill the space between the pipe and the screen. After the pipe had been lowered to the bottom of the well, gravel was poured into the space between the pipe and screen for a depth of 2 ft. and sand was poured on the gravel to a depth of 8 ft. The sand and gravel formed a tight wedge between the pipe and screen which became more secure as the pipe and screen were pulled from the well.

As the old screen was slowly pulled out, the hole filled up with sand and gravel. The new screen, which consisted of 12-in. pipe with the bottom 85 ft. perforated with  $\frac{3}{8}$ -in. holes on 14-in. centers, was then started back down by bailing sand and gravel from the inside. When the pipe had reached a depth of 99 ft., it was necessary to start driving it. After it had been driven for about 5 ft. the sand and clay were bailed out.

After the new screen had been driven to the concrete plug at the bottom of the original well the pump was in-

stalled. The well capacity had been increased to 2.1 mgd. from the 1.4 mgd. delivered before these changes were made. After two years of operation this well is still producing 2.1 mgd. and it is expected that the new screen and casing will last another twenty years.

### Softening and Purification Problems

A source of a great deal of trouble at Massillon was the constant replacement of the perforated piping in the bottom of the carbonating basin through which the carbon dioxide gas is discharged. It was never possible to carry a uniform distribution of the gas throughout the chamber for any length of time because of the lack of a durable metal or material. The perforations through which the gas was discharged became enlarged as a result of an acid condition caused by the moisture and the temperature of the gas. Galvanized and black iron pipe would last about two weeks before the  $\frac{1}{4}$ -in. holes would become enlarged and all the gas came up at one spot in the basin. Copper tubing, red brass and even bakelite were used before a suitable material was found.

The solution to the problem was a specially prepared glazed tile, with the  $\frac{1}{4}$ -in. holes drilled to specifications before the tile was glazed. These were installed in November 1943 and are still in service.

The success of the tile was due, in part, to the correction of another maintenance problem about the same time. The carbon dioxide gas used in the carbonating basins is manufactured in coke-burning hot-water boilers. During the summer a small hot-water heater is used and the water from the heater is used to slack the pebble lime. In the winter gas is taken from the

hot-water boiler which heats the plant. This gas was being taken from the fire box direct to a small chamber, which consisted of two 6-ft. lengths of 8-in. cast-iron pipe and a brick box about 4 ft. square. The purpose of the pipe and box was to cool the gas and to drop out any suspended matter. Very little cooling and settling occurred. The gas was then discharged direct to the basins by Roots-Connersville blowers. These blowers were overhauled about every two years because of hot and dirty gas. The gas going to the basins was also very hot.

In order to correct this condition, a large cooling chamber, about 15 ft. long, 3 ft. wide and 5 ft. high, was constructed of cement block. In this chamber are baffle walls and, at the discharge end, the gas must pass through a filter of limestone before passing to the blowers. The inside is covered with a thin layer of cement and several coats of acid-resistant paint. The gas, after passing through this chamber and filter, is cool, clean and dry. The construction of this cooling chamber and filter has reduced the maintenance on the blower equipment and undoubtedly to some extent accounts for the long service which the glazed tile is giving in the carbonating basins.

### Filters

Filters are a maintenance problem to most purification and softening plant operations. The Massillon plant has been in operation for fourteen years and the rapid sand filters were ten years old before they were completely rebuilt by replacing all the fine sand, torpedo sand and the first four grades of gravel. As the sand grows from the calcium carbonate deposit it is removed so that it will not discharge into

the wash water troughs. New sand is added occasionally. Trouble has been experienced with the calcium carbonate deposit which builds up in the influent pipe from the carbonating basins to the filters. This is a 20-in. pipe leading to the filters, out of which a 10-in. pipe leads into each of the four filters. The cleaning of the 10-in. pipes was accomplished by cutting the pipe and dropping out the section from the 20-in. header to the filter wall. The section was replaced by the use of a Skinner coupling and is no longer difficult to clean. The large 20-in. pipe, however, is still a problem to clean. This condition can be corrected by replacing the 20-in. pipe with an open flume to the filters.

### Pumps

During an electrical storm on July 8, 1943, lightning struck the Massillon plant and burned off the lead wires and several windings on the stator coil of the 150-hp. synchronous motor for the 2.5-mgd. high-pressure pump. These were quickly repaired and the motor was placed back in service. On July 15, however, the motor started to smoke and then stopped completely. A quick examination revealed that at least one and possibly all of the rotor coils were burned out. This trouble was considered serious because of the time required to rewind the coils. The other high-pressure unit has a capacity of 1.5 mgd. and could not meet the demand. While every electric dealer in northeastern Ohio was being called, the auxiliary supply was placed in operation. This consists of a 30-in. gravel well in which is installed a 2-mgd. Peerless turbine deep well high-pressure pump. This unit, although in first-class condition, had not been used for some time and the coupling

belt broke upon starting. Rope and bailing wire were used until a new belt was obtained. In the meantime, a repair shop in Cleveland agreed to repair the motor and it was immediately loaded on a truck and taken there. A rented induction motor was used while the repairs were being made. The motor was returned on July 30, but many anxious hours were passed while the rented motor was being used.

Pump failures are rare and their perfect operation is more or less taken for granted. The pump manufacturer deserves credit for producing a machine that has developed an efficiency that, for dependability and smoothness of operation, is comparable to the human body. The operator who tends the pump year after year gets to know its every whim. Hour after hour he hears its hum and, should the tone change, he knows it at once and looks to see what is wrong. This accounts for the unfailing good maintenance that seems to be given pumping equipment. When a pump is kept in continuous operation for twenty years or more it is obvious that it has been given good care.

Details of good maintenance vary in different plants, but they all involve routine inspections of different items, some several times a day, some once a day, and some every few months. But generally a good job is done on maintaining pumps.

### Valves, Hydrants and Appurtenances

In the distribution system, because of the large amount of pipe, fire hydrants, valves, service lines and other appurtenances, are found the greatest number of maintenance problems. A thorough knowledge of the distribution system, especially valve locations, will make maintenance work much easier,

especially at night or during the winter when the ground may have a covering of snow. At Massillon each of the service trucks is equipped with a valve location book. In this book, each street is shown in alphabetical order at the top of a page, under which are listed all the valves on that street, showing the measurements in relation to all curb lines. If a main leak is reported, the section can be shut down immediately, without the necessity of locating valves which may be covered if the street is unimproved or covered with snow. Repairs to main leaks no longer require long shut-downs, as in the old days, when lead pots, salamanders and heavy cast-iron fittings had to be hauled out and installed under severe weather conditions. Now these repairs are made with repair clamps, bell joint clamps and other fittings which do not require poured joints and calking, and which are installed in one-fourth the time.

Fire hydrants, on which there are watch valves, eliminate lengthy shut-downs for repair when they are broken or leaking. Many hydrants are broken by traffic and, unless the barrel is completely shattered, it can be welded and re-used. It is good practice to carry a few repaired barrels in stock. A thorough and complete inspection of all hydrants, throughout the winter, is not only a safeguard in assuring perfect operation, but avoids many difficult maintenance problems.

The opening and closing of valves should be known and noted in a valve book or valve record. Care should be exercised where it is necessary to apply force.

When a main break occurs and there is danger of damage from flooding, the superintendent must be sure that all closures are completed. It is essential

that all appurtenances of the system be known and kept in good working order to meet any emergency.

The proper installation of service lines to a depth that will avoid any danger of freezing is the surest way of reducing service maintenance. The depth of the main and the conditions and kind of soil also govern the precautions that should be taken to prevent freezing. Whenever possible the installation of service lines in or near sewer trenches should be avoided. Also, curb boxes should not be installed in or near driveways where they might be broken off or forced down to shear off the service line when traffic passes over the box.

Much labor and time can be saved in turning services off and on, if the curb rod is used instead of the T socket head on curb stops. The curb rod, which is  $\frac{1}{2}$ -in. square iron for  $\frac{3}{4}$ -in. curb stops and  $\frac{3}{4}$ -in. square iron for 1-in. curb stops, is about 36 in. long and fits down into the socket head of the curb stop. When the rod extends up 36 in., any dirt which falls into the box will not prevent or delay the operation of the curb stop.

### Meters

Meter maintenance is one of the most important departments of the water supply business, and it is surprising to discover that, in far too many water works plants, very little attention is paid to the meter, once it has been bought and installed. In some localities, meters are allowed to remain in service until such time as they fail to register. In many cases, the manager or superintendent has little, if any, knowledge of the operating mechanisms or the characteristics of the instruments on which they depend for revenue.

Periodic testing of meters is practiced in many plants, the frequency of testing depending on the type and kind of water the plant is supplying. A five-year plan is followed at Massillon. The meters are removed, tested and disassembled. The casings are given an acid bath and cleaned on buffer. Worn parts are repaired or replaced where necessary. After the repairs have been made the meter is tested, the register is set back to zero and the meter prepared for resetting.

All meters are removed as soon as the meter reader reports leakage, stoppage or damage by freezing or other means. Meters are removed from vacated houses if a new tenant does not immediately sign up for service. These meters are sent through the same

routine of repair and testing as outlined above.

Since meters are read monthly at Massillon it is possible to keep a continuous check on the meters, and all broken glasses, dirty dials and missing lids are immediately reported, as are leaking stuffing boxes and noisy meters.

All meters, 2 in. and smaller, are removed from service for test or repair, and those over 2 in. are tested in service by comparison with a test meter. Meters 2 in. and larger are tested once a year.

The task of maintaining a water works system requires constant diligence and foresight, which in turn provides smooth operation, unflinching service, pure and safe water at a minimum cost.

## ERRATUM

The JOURNAL regrets that in the publication of "Transformations of Iron by Bacteria in Water," by Robert L. Starkey, which appeared in the October 1945 issue (37: 963-984), mention of its source was omitted. "Transformation of Iron by Bacteria in Water" was originally presented at the Inservice Training Course for Water Works Personnel, conducted by the School of Public Health of the University of Michigan, Ann Arbor, on May 22-24, 1945.

## Coagulation and Benefits From Good Floc Formation

By R. W. Ockershausen

General Chemical Co., New York, N.Y.

Presented on Nov. 9, 1944, at the Four States Section Meeting, Philadelphia, Pa.

THIS discussion is directed toward the practical problems involved in the use of coagulants. No attempt will be made to discuss coagulation from a technical standpoint.

Reduced to simplest terms, rapid sand filtration involving the coagulation of water is first a chemical, then a mechanical, process. By chemical means a large part of the objectionable matter is drawn into a more easily removable form, and then, by mechanical means, these particles containing the objectionable matter are built up into large particles that will settle readily. The few that do not settle are rejected from the water by the filters. Nearly all of the "trick" of the process is involved in the coagulation of the raw water. Mistakes made at this point cannot be easily corrected later and, on the other hand, conscientious and intelligent care will largely insure a superior finished water, with a consequent reduction in the over-all operating and maintenance costs of the filters.

### Difference Between Precipitation and Coagulation

In discussing water coagulation one might ask: What is the difference between precipitation and coagulation, and what is a good floc? The term precipitation is loosely used by many to denote coagulation. There are wa-

ter plants obtaining precipitation but not good coagulation or floc formation. To illustrate the difference, for example, a moderate dose of lime, when fed without coagulant to a calcium bicarbonate water, will produce precipitation, but one would hardly call the granular, sometimes very fine, precipitate of calcium carbonate a good floc. Likewise with coagulants, a plant may obtain precipitation instead of floc formation, and lose many of the benefits that should be derived from the treatment. Coagulation goes further than precipitation. A good floc is a hydroxide particle that may be as large as  $\frac{3}{8}$  in. Some plants obtain larger flocs, many smaller. The floc particle starts as a fine precipitate in the water, which, during the process of agitation, comes in frequent contact with and adsorbs nearly all of the objectionable suspended material, color and bacteria in the liquid. This particle, with its occluded foreign material, finally grows to a large size, and in this form settles readily under the quiescent conditions that should prevail in the settling basins. In this way the objectionable material that has been mechanically incorporated in the floc is mechanically removed with the floc in the settling basins. The difference between precipitation and coagulation is pointed out, because anything short of the lat-

ter usually finds the plant lacking in the ability to remove effectively turbidity, color, bacteria and even taste and odor.

### **Turbidity Removal**

It is hardly necessary to elaborate on turbidity removal by coagulation, because this is one of the fundamentals that made possible the rapid sand filter. Muddy river supplies, unusable even after sedimentation, are turned into sparkling clear waters by coagulation. One thinks of sand filters having filter media with an effective size of 0.40–0.50 mm., and rated to produce about 2 gpm. per sq.ft. Careful preparation of the water, and by this is meant thorough coagulation and sedimentation, is changing this view and making possible the use of filters with coarser sand (0.7 mm. effective size), capable of producing as much as 4 gpm. per sq.ft. This serves to show the importance of forming a well-defined floc, one that sweeps out turbidity and settles rapidly. The trend is definitely toward high coagulation efficiency as a means of filtering at higher rates. Economies in the size of filter structures, ease and flexibility of filter operation and savings in wash water, in addition to the higher quality product delivered to the customer, are the results.

The settling basins can do their full share of the work only when a well coagulated water is introduced to them. Unless this is accomplished the filters may suffer from mud balls, a pulling away from the side walls, heaving, rapid loss in head, low filter runs, high wash water requirements, lower quality effluent and other ills. The design of many existing plants may preclude high-rate operation, but whether the plant is new or old, whether it oper-

ates at a high or low rate, it still holds that maximum filtration efficiency will be obtained in the average plant only when floc formation is at its best.

### **Marginal Coagulant Doses**

The very small coagulant dose used in one plant was once referred to as a "homeopathic alum dose." The dose of about 3.4 ppm. was a marginal one, barely capable of producing a precipitate, much less a well-defined floc. This was a well-supervised plant, however, and it had the advantage of a raw water of constant good quality; mixing was very thorough, and, unlike the average plant, it had an extremely long settling period. Excellent results were obtained in this plant, but such borderline treatment would be dangerous in the vast majority of filter plants where conditions are seldom as perfect as this.

Not far distant from the above plant is a large water works treating a flashy river water. This plant also has a long settling period, sometimes longer than three days. Unlike the former plant, however, this plant's raw water varies in quality and has a turbidity of 1,000 ppm. or higher. Long experience has proved the value of providing a safety factor above the minimum dose of coagulant that will produce floc. Filter troubles are uncommon at this plant, and it is the practice to wash filters after 300 hours, "whether they need it or not." The important requirement for the average operator, whose plant seldom has ideal conditions, and whose diverse duties prevent frequent checking of floc formation, is to feed sufficient coagulant with a margin of safety so as to absorb shocks or slight changes in the coagulant demand of the water. This practice has paid dividends and returned

benefits in the average plant under average conditions.

### Reduction of Microscopic Organisms

At various times during the year filter runs may become seriously shortened for reasons not always apparent. A microscopical examination of the raw water will frequently show the presence of large numbers of filter-clogging organisms. A classic example of this was experienced several years ago by C. J. Lauter, Chief Chemical Engineer in the Washington, D.C., water purification plants. Floc formation was good at this plant but filter runs still dropped off seriously. Copper sulfate and higher doses of chlorine were used but the condition showed no improvement. Even though the organisms were killed, their bodies still carried over to the filters, causing them to clog. Lauter found that by raising the alum dose it was possible to entangle the live and dead organisms in the floc and carry them down in the settling basins. The Washington experience was extreme, and during less serious sieges of such organisms a well-formed floc will do much toward leveling off filter performance. Many operators are aware of this and by watching water temperatures and the season of the year can anticipate, to a certain extent, when the sieges are likely to occur.

### Taste and Odor Reduction

Very little literature has been published concerning the reduction of tastes and odors by coagulation, and yet most of us know that when we clean up a water by such treatment it is rendered more palatable. What has been said and published may be summed up briefly in the following sentences. Coagulation may remove up to 60 per cent

of the threshold odor of water, depending on the type of odor-producing substance present. Organic and other colloidal matter that produces tastes and odors can be almost completely eliminated by floc-forming chemicals. Where the odor is from trade wastes or from soluble oils, the products of microscopic organism decomposition, coagulation is less effective.

W. R. Gelston, Superintendent of Water Works, Quincy, Ill., has done some interesting work on taste and odor reduction with aluminum sulfate. To borrow a commonly used prefix of today, it might be said that he practiced "super-coagulation" during the course of his test. Normally a dose of 17 to 34 ppm. of aluminum sulfate is used in this plant. During troublesome taste and odor conditions it was found that by increasing the coagulant dose the odor was considerably reduced. A large dose of carbon had been required at this particular time. The difference between the cost of aluminum sulfate and carbon was great enough to give the coagulant an advantage in this instance. Not unmindful of certain disadvantages to high coagulant doses, "super-coagulation" should be further experimented with by operators equipped to do this kind of work. There is too little known about it now to suggest its general adoption without further experimental proof of its value.

Normally, coagulation is considered an aid to taste and odor removal by the highly effective methods employing activated carbon or high-rate chlorination; seldom has it been able to take their places. The point here is that a well-formed floc has a fairly large surface area, capable of adsorbing certain foreign materials that produce taste and odors. The operator should take ad-

vantage of this to the degree his experience justifies.

### **Other Benefits**

It has been well established that from 60 to 85 per cent of the bacteria in the average water are removed by coagulation and sedimentation. Regarding bacteria removal, Charles Cox has written: "Special attention must be given to the supervision of the treatment of waters fluctuating in quality. . . . This is especially true of the need for adjusting the dose of coagulants and chlorine to compensate for rapid changes in quality of the raw water." A number of operators who have been able to improve floc formation in their plants have reported reductions in the chlorine dose. Chlorine gives more effective kill of bacteria when some of the organic and chlorine-demanding colloids are removed by coagulation.

Regarding color removal, unless more than a "lazy" floc is developed the treatment will be ineffective. With a well-formed floc color can be reduced to 10 ppm. or lower, even with a raw water having the appearance of tea.

### **Determining Dose for Good Floc Production**

Numerous advantages of good floc formation have been pointed out but a discussion of this sort would be incomplete without some reference as to how to obtain a good floc.

A chemical analysis of a water is not enough to tell how effectively it can be coagulated and what quantity of chemical is necessary. The physical characteristics of the water, as well as the chemical properties, have a bearing on the coagulant requirements. There is only one real way to determine the dose and that is by means of the simple jar test. There is no substitute for this

test. A stirring machine for making the floc tests is not absolutely necessary but very desirable, for, depending on the number of water samples that can be stirred in the machine, that many different doses can be tried at one time. In the absence of a well-equipped laboratory with a 3-, 4- or 6-place stirrer, several 1- or 2-qt. fruit jars can be used to good advantage and the samples can be stirred by hand.

### *Factors in the Jar Test*

It is preferable to use 2-qt. samples for the floc tests although 1-qt. samples are adequate. There are several other points of importance. Once the jars are filled and in position, the stirring machine should be started before the aluminum sulfate solution is added. Many operators have found that, if there is even a short lag between the addition of the chemical and the starting of the stirrer, the floc does not develop as effectively as when the chemical is added to an actively agitated sample. This follows plant procedure, where the coagulant is always added to the water while it is in motion. Not only should the dosing of "still" samples be avoided, but the mixing of the sample should be done with care. A rapid initial mix of one or more minutes, as experience dictates, is highly desirable for quick dispersion of the alum in the water. Dilute chemical solutions aid in obtaining immediate dispersion and enable accurate dosing. The rapid initial mix should be followed by 10 to 30 minutes of slow agitation just sufficient to keep the floc particles in suspension and permit them to grow in size. If desirable, this slow mixing period may be timed to conform with the mixing in the plant.

By means of the jar test the proper dose of coagulant can be determined.

The test will quickly indicate whether alkali or acid addition for pH and alkalinity adjustment are necessary for effective floc formation. The results will show how much, if any, of these agents are required. The floc test will show the dose of chemical needed for the removal of practically all of the color and at the same time indicate the minimum dose that could be used if a certain amount of color in the finished water can be tolerated. Experiments with nearly every chemical means of improving floc formation can be made before trying them on the plant. For these reasons the procedure should be standard practice in every water filtration plant where coagulation of raw water for turbidity, bacteria and color removal is necessary.

### Conclusions

Norcom and Brown have formulated one of the best conclusions that

could be drawn on adequate floc formation. They state: "... that coagulation process is the heart of the rapid sand process. Failure to give constant attention results in a poor product, filter deterioration, waste of chemicals and thoroughly unsatisfactory conditions."

Coagulation goes further than precipitation. When a well-defined floc is developed in the water it will effectively remove turbidity, color and bacteria and will aid in the reduction of tastes and odors. Operation and effluent quality will be improved. The simple jar test is the best method for determining the proper treatment to be given the water. This test will insure against underdosing or overdosing. There is no justification for overdosing and wasting of chemicals, but there is a strong case for sensibly controlled coagulation.

# The Removal of DDT From Water Supplies

By John A. Carollo

Constr. Engr., Ferguson, Carollo & Classen, Phoenix, Ariz.  
Formerly Capt., Sn.C., Fourth Service Command Medical Lab., Ft. McPherson, Ga.

A contribution to the Journal

THE anticipated widespread use of DDT [(2,2-bis(p-chlorophenyl) 1,1,1-trichloroethane)] by the Armed Services for the control of disease-bearing or pest insects presented many problems to the Preventive Medicine Branch of the Medical Department of the Army. Early in the program one of the questions regarding the use of DDT as a mosquito larvicide was, "What effect would DDT have upon the water supply of troops?" In advanced areas, especially, gross over-treatment was likely to occur. The Army also wanted to know if water so treated could be made safe by the current field methods of water treatment, and, if not, what methods would have to be developed. The men responsible for civilian water supplies in the continental United States would also be interested because many watersheds used for domestic water supplies will be treated with DDT for mosquito control. These problems, among others, were studied at the Fourth Service Command Medical Laboratory during 1944 and 1945.

## Problems Concerning Water Works

The problems of concern to the water works profession are as follows:

(1) What concentration of DDT in a water supply may safely be permitted?

(2) What effect do "natural" purification agencies—storage, sunlight,

sedimentation, etc.—have upon the toxicity of DDT?

(3) How effective are the commonly used methods of water treatment in the removal of DDT from water?

Before these questions could be adequately answered, it was necessary to be able to determine the amount of DDT in water. During the early stages of our work a chemical method for determining DDT in water was not available but earlier work on the effect of various natural waters on DDT had provided a limited biological assay method. Minute amounts of DDT could be detected because we had determined that from 0.001 to 0.0015 ppm. of DDT in water would kill from 70 to 100 per cent of the larvae of *Aedes aegypti* mosquitoes and that 0.03 ppm. would kill 100 per cent of *Anopheles quadrimaculatus* larvae in 48 hours. The *A. aegypti*, especially, proved extremely reliable test animals.

During May 1945, the Xanthidrol-KOH-Pyridine method for the determination of DDT in water had been tested sufficiently for us to know its limitations. It made possible the chemical determination of concentrations of DDT in water as low as 0.05 ppm. Because the final color developed in the test sometimes disappears before the optical density can be determined on a spectrophotometer, duplicate samples must be run. A standard of DDT

with each batch of samples is run to overcome variations in the reagent solution and a correction is made to the individual test results.

The Bent's method (nitration and addition of alcoholic KOH) eliminates the difficulties caused by moisture and color disappearance in the Xanthidol-KOH-Pyridine method. Complete recovery of DDT from water has not yet been possible. The extraction of DDT from water with chloroform is somewhat less complete, but more uniform than with ether.

### Toxicity of DDT in Drinking Water to Mice

Many experiments on the toxic effect of DDT upon warm-blooded animals had been performed, but, to our knowledge, none of these included tests in which the test animals' water contained DDT. Therefore, the following experiments were conducted:

*Test A:* Ten mice were furnished water containing 10 ppm. of DDT and triton and 30 ppm. of xylene as their only source of water for 75 days. For controls, ten mice were given water containing triton and xylene, but no DDT, and ten mice were given tap water.

*Test B:* Ten mice were furnished water containing 50 ppm. of DDT and triton and 150 ppm. of xylene as their only source of water for 58 days. The controls were similar to those of Test A.

The DDT solutions were freshly made up every second day throughout the test period. The mice were observed daily during the test and for 30 days thereafter. Two females gave birth to healthy litters during the latter part of the test period. No ill effects were observed in either batch receiving DDT or in the control groups during the entire period.

### "Natural" Purification

#### Storage

Earlier in the work at the Fourth Service Command Laboratory it was noticed that DDT in water gradually lost its ability to kill mosquito larvae. The following tabulation shows the number of hours' storage required for various concentrations of DDT to lose their ability to kill *A. aegypti*:

DDT, ppm.	Storage Time, hr.
0.0015	48
0.003	96
0.01	120
0.04	288
0.1	312 +

Sedimentation cannot be the explanation of this phenomenon because DDT is soluble in water, at least to 0.0015 ppm., and this concentration is sufficient to kill *A. aegypti* in 48 hours. Direct sunlight is not necessary for the process because such tests have been run indoors in semidarkness.

#### Turbidity

The fact that highly turbid waters do not interfere with the 48-hour kill of mosquito larvae by DDT has been demonstrated with a number of waters, including water from a stream receiving the effluent from a plain sedimentation sewage plant, as shown in Table 1.

An indication that DDT is partly removed from water by the sedimentation of clay suspensions is shown by the reduction in the 48-hour kill of *A. quadrimaculatus* larvae when water containing 0.1 ppm. DDT and clay is coagulated and filtered before larvae are placed in it. The high kill of *A. aegypti* proves that this treatment produces only an incomplete removal of DDT (see Table 2).

TABLE 1

*Effect of Turbidity on Kill of Aedes aegypti Produced by DDT (.0015 ppm.)*

\* Color 160 ppm.

The work reported in the two preceding paragraphs explains the poor kills of more resistant larval species, such as *A. crucians*, sometimes observed when treating *natural turbid waters*. Sedimentation of finely suspended matter in these waters will physically remove the greater part of the DDT that is itself held in suspension. This is similar to the removal of DDT from water by coagulation and sedimentation (see below). In addition, the small amount of DDT remaining in solution deteriorates, as shown in the tests on the effect of simple storage. These two processes lower the DDT concentration, comparatively quickly, to a point where resistant

larvae are not killed. In clear water the sedimentation of DDT is at a much slower rate and the part in solution is maintained by contact with the dispersed solid phase. These considerations do not affect the experimental 48-hour kill of larvae, since the time interval between addition of DDT and larvae is not sufficient to allow operation of these factors. The larvae themselves are killed as readily by the same concentration of DDT in both clear and turbid waters.

#### Effect of Water Purification on Removal of DDT

The ability of water purification methods to remove DDT was studied

TABLE 2

Effect of the Sedimentation of Turbidity on the Removal of DDT From Water

DDT ppm.	FeCl <sub>3</sub> ppm.	Clay ppm.	Percentage Kill in 48 Hours

from January through July 1945. The city of Atlanta co-operated by permitting the laboratory to use the facilities at the water treatment plant. The effectiveness of a treatment was tested

biologically during the early part of the work; later the Xanthidrol-KOH-Pyridine and the Bent's methods were used. This work brought out the following facts:

(1) Mechanical flocculation for 30 minutes with alum, followed by one hour sedimentation and decantation, removed 40 per cent of the DDT from water containing 0.1 ppm., and 50 per cent from water with 1.0 to 10.0 ppm.

(2) Mechanical flocculation for 30 minutes with ferric chloride or ferric sulfate, plus one hour of sedimentation and decanting, removed 60 per cent of the DDT from water containing 0.1 ppm. and 80 per cent from water containing 1.0 to 10.0 ppm.

(3) Mechanical flocculation for 30 minutes with alum, plus one hour of

sedimentation and filtering, removed 84 per cent of the DDT from water containing 0.1 ppm. and 95 per cent from water containing 1.0 to 10.0 ppm.

(4) Mechanical flocculation for 30 minutes with ferric chloride or ferric sulfate, plus one hour of sedimentation and filtering, removed 80 per cent of the DDT from water containing 0.1 ppm. and 97 per cent from water containing 1.0 to 10.0 ppm.

(5) Statements 1 through 4 are substantiated by the test results shown in Table 3. The DDT in the treated water was determined by the Xan-

thidol-KOH-Pyridine method. The raw water was taken from the Atlanta Water Works storage reservoirs.

(6) Practically 100 per cent of 1.0 ppm. DDT in water is removed by mechanical flocculation for 30 minutes with alum, ferric chloride or ferric sulfate; filtering; and, in addition, fifteen to 30 minutes' contact with 1.65 ppm. of activated carbon kept in suspension mechanically and then filtered out. Increasing the carbon to 5.0 ppm. removed more of the DDT. Adding talc to the coarse filter paper removed more of the fine floc and carbon containing DDT. If water containing DDT is treated with carbon and the carbon is not subsequently entirely removed, larvae placed in the water will eat the carbon and be killed. While considering the data in Table 4 it must be remembered that 0.0015 ppm. of DDT in water will kill 80 to 100 per cent of *A. aegypti* in 48 hours and frequently 60 to 80 per cent in 24 hours. Further, the tabulated results are averages of a

The great many tests. There are indications that the iron salts remove more DDT than does alum.

(7) Adding the activated carbon with the coagulant does not remove as much of the DDT as adding it after the floc is removed from the water and again filtering (see Table 5).

(8) Twenty-four-hours' quiescent contact with carbon after the floc is removed does not remove the residual DDT (see Table 6).

(9) Four to 24 hours of air mixing activated carbon with settled or filtered coagulated water produced no better results than 30 minutes of mechanical stirring for the removal of DDT (see Table 7).

(10) Twenty hours of aeration following coagulation and filtering did not remove all of the DDT from waters containing 0.1 and 1.0 ppm. (see Table 8).

(11) Filtering clear water containing 0.1 and 1.0 ppm. DDT, through filter sand, anthrafil, diatomaceous earth, sodium zeolite or the cation amberlite did not lower the DDT con-

0.1	FeCl <sub>3</sub>	15.0	0	69

tent to a point where it would not kill *A. aegypti* (see Table 9).

(12) Filtering clear water containing 0.1 ppm. DDT through a cation and then an anion amberlite filter removed all the DDT. When the DDT was raised to 1.0 ppm., sufficient DDT passed through both filters to produce 100 per cent kill of *A. aegypti* in 24 hours (see Table 9).

The foregoing data show that the greater part of a DDT suspension in water is removed by coagulation and filtration. Among the coagulants tried, those with the iron cation removed a somewhat greater proportion of the DDT than other coagulants. This treatment apparently does not remove

TABLE 8

DDT in Untreated Water, ppm.	Chemical Treatment, ppm.		Flocculation Time, min.	Aeration Time, hr.	Treated Water Percentage Kill in 48 hr.

1.0		10	30	20	91	100

DDT in solution or extremely fine suspension. If it is desired to remove the residual portions of DDT remaining after coagulation and filtration, three methods are possible: (1) storage for four or five days; (2) filtration through cation and anion zeolites; (3) intimate contact with approximately 2.0 ppm. of activated carbon after coagulation and sedimentation, but before final filtration.

### Summary

DDT applied to any water gradually loses its ability to kill *A. aegypti*

TABLE 9

Effect of Water Treatment on Removal of DDT

DDT in Unfiltered Water, ppm.	Type of Filtration	<i>A. aegypti</i> Percentage Kill	
		24 Hours	48 Hours
0.1	Anthrafil rapid sand	—	96
0.1	Anthrafil rapid sand	—	100
0.1	Anthrafil rapid sand	—	97
0.1	Diatomaceous earth filter	98	—
1.0	Diatomaceous earth filter	100	—
0.1	Diatomaceous earth filter, talc and activated carbon	56	86
0.1	Sodium zeolite	—	100
0.1	Sodium zeolite	—	100
0.1	Cation amberlite	7	93
0.1	Cation and anion amberlite	2	3
1.0	Cation amberlite	100	100
1.0	Cation and anion amberlite	100	100

larvae, so that 0.0015 ppm. becomes ineffective in 48 hours and 0.1 ppm. in from ten to twelve days.

Turbidity in water has little effect on the 48-hour kill of mosquito larvae by DDT, but upon settling out will remove some of the DDT held in suspension.

The normal concentrations of DDT used in mosquito larviciding work will not produce toxic effects in warm-blooded animals drinking water so treated.

Any of the conventional water treatment processes involving coagulation, sedimentation and filtration will remove from 80 to 98 per cent of DDT in a water supply originally containing from 0.1 to 10.0 ppm.

Complete removal (to less than 0.001 ppm.) of DDT from a water supply is possible if intimate contact with activated carbon is provided for fifteen minutes after coagulation and sedimentation, but before filtration.

### Acknowledgments

The author wishes to express his appreciation for the fine co-operation and assistance given him by the following enlisted men: S/Sgt. B. A. Barrington Jr., Sgt. Donald B. Barber, Cpl. A. F. Morgenthaler, Cpl. C. C. Haffey, Pfc. George V. Haden and Pfc. Vincent J. Dean.

The encouragement and guidance given the author by Col. Loren D.

Moore, M.C.; Col. M. J. Blew, Sn.C.; Major J. S. Harris, M.C.; and Major S. J. Carpenter, Sn.C., were greatly appreciated. The co-operation shown by

Paul Weir, Superintendent of the Atlanta water treatment plant, and his assistants did much to make the work possible.

#### DISCUSSION—Harry E. Jordan

The papers concerning the use of DDT in controlling insect infestation in public water supplies and the removal of DDT from water to which it has been added appear to indicate the propriety of comments concerning the general policy of using this material in water treatment.

The circumstances related to the use of DDT at Alexandria, Va., which were fully recorded in this JOURNAL for November in an article by Martin Flentje, clearly indicate the necessity for courageous and positive action. Infestation of the type discussed is not widespread. It appears that, on the basis of present evidence, water treatment operators, as well as the public generally, need not anticipate that DDT is likely to be a regular addition to the list of chemicals used in water treatment.

Discussion of the subject with a nationally prominent toxicologist has led him to outline the five following comments which merit full consideration:

1. The concentration of 0.01 ppm. DDT, which has been advocated for control measures in reservoirs, is far below the dose toxic to human beings.

2. In attaining this concentration it is assumed that the utmost care would be employed to assure rapid and uniform distribution of DDT and that accumulations such as represented by emulsified material could by no possibility reach the consumer.

3. The application of DDT to drinking water should be in the hands of skilled personnel only—individuals who are fully aware of the danger involved.

4. Consumers should have full knowledge that the drinking water has been so treated.

5. While the quantity 0.01 ppm. is below the toxic threshold, we know very little about possible accumulative effects in man. In discussing the possible toxic effects of this concentration of DDT in drinking water with a prominent scientist who has made extensive studies of DDT poisoning, he professed personal reluctance to drinking water with this concentration of DDT for any extended period of time.

There is a vast array of technical and quasi-technical information being made available to the public concerning the uses, the merits and the demerits of DDT. The places where the material may be useful are not fully known. The conditions under which its use is definitely not indicated are likewise not fully known. The dangers which may accrue from continued contact with it in any form must be the subject of extended investigation before any authoritative comments upon the matter can be made. As an emergency treatment material, under the conditions outlined by Mr. Flentje in his article, DDT is clearly shown to have merits. At the present time, however, there is no concrete evidence to indicate that human beings are able to tolerate physiologically any substantial concentration of DDT continuously either in food or in drinking water.

Controlled research must be depended upon to provide the answer to such questions. Results of such research are not available at the present time.

# Design and Construction of Geist Reservoir

By Claris Allen

Prin. Asst. Engr., Indianapolis Water Co., Indianapolis, Ind.

A contribution to the Journal

IN 1923, the Engineering Department staff of the Indianapolis Water Company, working under the direction of the late Leonard Metcalf, Consulting Engineer, began studies and investigations to determine ways and means of securing additional water supply for Indianapolis, Ind. The Geist Reservoir became an actuality largely due to the personal efforts of H. S. Morse, Manager of the Indianapolis Water Company since 1925, who directed and prosecuted the project.

In 1923 the population of Indianapolis was 343,000, and it was estimated that the city would grow to about 500,000 in 1940, and 600,000 in 1960. The 1940 census shows that the actual population was 386,972, with an estimated population served by the water company of about 400,000. (Figure 1 shows the population growth from 1930 to 1944.)

Indianapolis, whose population ranks twentieth in the United States, is an inland city. Unlike most large cities, it does not have the advantage of being located on a large river or lake, but must depend on small streams and ground water for its water supply. (See Fig. 1 for average daily pumpage at Indianapolis from 1930 to 1944.)

## Water Sources

A study to determine a source of water supply for the city was limited

to the following four sources: (1) ground water, (2) the West Fork of White River, (3) Fall Creek and (4) other minor tributaries of White River.

The Indianapolis Water Company has already substantially developed the underground supply.

The West Fork of White River has a drainage area above Indianapolis of 1,190 sq.mi. and the flow at Indianapolis in times of drought has been as low as 43 cfs. on one occasion, and frequently, for periods of weeks, the flow has been less than 100 cfs. The White River has been the main source of supply for the city for many years. Until 1943, however, no storage facilities had been developed to make more advantageous use of the available surface supply.

Fall Creek, a tributary of White River, has a drainage area of 306 sq. mi. above Indianapolis. The flow of this stream on occasion has been as low as 7.8 cfs. For weeks during the summer months the stream flow has been under 20 cfs. However, it has been found that, by impounding, a substantial increase in the city's water supply can be obtained from the stream.

The next largest tributary of White River is Eagle Creek, with a drainage area of 170 sq.mi. This stream has, on occasion, gone dry. Other minor tributaries have small drainage areas and insignificant flows.

FIG. 1. Population of Indianapolis Water Co. Service Area and Average Daily Pumpage—1930–1944

Metcalf, as a result of his study made in 1923, recommended the development of a surface supply as the most dependable, and selected Fall Creek for the first step in this development.

### History of the Geist Reservoir

The report submitted by Metcalf recommended that the company, as additional future water demands required, proceed with the development of two impounding reservoirs to furnish additional water supply for the city. The first of these reservoirs was to be located on Fall Creek, near the town of Oaklandon, Ind., at a point about 16 mi. northeast and upstream from Indianapolis. The other reservoir, recommended for development at a later date, was to be located on White River.

The water company initiated detailed investigations and surveys for the reservoir project on Fall Creek and began acquisition of land in 1928. The project has been named "Geist Reservoir" in honor of Clarence H. Geist, President of the Indianapolis Water Company from 1913 until his death in 1938.

Detailed topographical surveys of the basin were completed in 1930, and foundation borings and investigations at the site of the proposed dam were finished in 1931.

Investigations, design and preparation of plans progressed during the depression years after 1931, so that at the end of the depression, when the need for an increased water supply became urgent, the company was ready to begin construction of the reservoir.

Construction work was started in May 1941, and was completed sufficiently to begin storage of water on Dec. 22, 1942. The spring runoff was such that the reservoir was completely filled on Mar. 17, 1943, and it was placed in service on that date. The major construction work was completed in 1943.

The Geist Reservoir impounds sufficient water to provide a dependable 25-mgd. additional water supply average for the year, with normal variations. The utilization of this entire impounded supply is dependent upon the completion of the new Fall Creek purification plant, now developed to one-half of its ultimate capacity.

### Description of the Reservoir

The reservoir occupies the valley of Fall Creek north of the town of Oaklandon. The area, for the most part, was cultivated farm land, with some scattered wooded areas.

Figure 2 is a map of the reservoir and shows the shape and location of the body of water created. Figure 3 gives a panoramic view of the area.

Table 1 shows area, capacity, elevations and other reservoir data.

### Design

The hydrographic design of the reservoir was based on the runoff oc-

FIG. 2. Map of Geist Reservoir, Showing Shape and Location of Body of Water Created

curring during the 1930 and 1931 drought period. The 1930 and 1931 drought was the period of least runoff up to the time of the hydrographic design of the reservoir, although it was realized that later periods might produce more severe conditions. Consideration was given to the fact that existing wells could be used to supplement the reservoir supply during such periods, should they occur. The stream flow was measured at Millersville, Ind., a small village on Fall Creek, about 8 mi. above Indianapolis, where a gaging station had previously been established by the company. The stage on the stream was recorded by an automatic water level recorder. A rating curve was constructed after stream discharge measurements were made to define the stage discharge relation. The determination and publication of runoff at this station has now been taken over by the local district office of the Water Resources Branch of the U.S. Geological Survey.

The problem of determining the reservoir storage required to provide the average useful supply of 25 mgd. was solved by constructing the usual

mass curve of accumulated daily stream flow, in combination with a draft curve representing withdrawal and losses from the reservoir. The mass curve represents approximate daily stream flow at the dam site. This was determined by plotting 71 per cent of the measured stream flow at Millersville, since the drainage area at the dam site is 71 per cent of the Millersville drainage area. According to many authorities, the runoff varies more nearly as the two-third's power of the ratio of the drainage areas, which in this case would be about 80 per cent; nevertheless, use of the 71 per cent factor was adopted since it would give more conservative quantities of runoff. The draft curve was constructed using an average useful demand of 25 mgd. and varying this average in direct proportion to the actual variation of the entire city's pumpage throughout the dry period studied, to which was added compensation water to the stream and evaporation loss from the reservoir.

In 1937, the U.S. Weather Bureau established an evaporation station at Indianapolis. The evaporation record from this station, when translated into

TABLE 1

*Data on Geist Reservoir of Indianapolis Water Company*

## HISTORY

First conception of project .....	1923
Studies, investigations and preparation of plans .....	1923-1941
Construction .....	1941-1944

## DATA

*Reservoir*

Reservation area, acres .....	5,455
Water surface area, acres .....	1,800
Marginal land area, acres .....	3,655
Capacity, mil.gal .....	6,900
Length, mi. ....	7.45
Length of shore line, mi. ....	35.00
Maximum width of water surface, mi. ....	1.30
Minimum width of water surface, ft. ....	100
Average width of water surface, mi. ....	0.40
Watershed above Fortville, sq.mi. ....	175
Watershed above dam, sq.mi. ....	215
Watershed above Millersville, sq.mi. ....	306

*Dam*

Over-all length of dam, ft. ....	1,900
Length of spillway, ft. ....	500
Height of dam (above valley floor), ft. ....	40
Height of dam (above original creek low water), ft. ....	47
Top width of dam, ft. ....	24
Bottom width of dam, ft. ....	230
Height of spillway (above valley floor), ft. ....	26
Height of spillway (above original creek low water), ft. ....	33
Elevation of crest of spillway (above sea level), ft. ....	785
Elevation of top of dam (above sea level), ft. ....	799
Earth work, cu.yd. ....	336,000
Concrete, cu.yd. ....	33,000
1943 flood flow, mgd. ....	5,800
1943 flood (head on spillway), ft. ....	3.0
1913 flood flow, mgd. ....	13,000
1913 flood (head on spillway), ft. ....	5.0
Maximum design flood, mgd. ....	32,000
Maximum design flood (head on spillway), ft. ....	9.5

*Roads, Bridges and Miscellaneous Work*

Public roads submerged, mi. ....	3.5
Public roads vacated, mi. ....	7.5
Public roads built, mi. ....	7.0
Existing bridge structures removed .....	5
Bridge structures built * .....	2
Existing bridge structures raised .....	1

*Costs*

Entire project (including land) .....	\$2,500,000
Storage, per mil.gal .....	\$362
Filter capacity (32 mgd.), per mil.gal. ....	\$78,000

\* The new bridges were designed for a 20,000-cfs. flow, with a 4-ft. clearance under the super-structure.

FIG. 4. Mass and Draft Curves

equivalent evaporation from pond surfaces by using the usual pan coefficient of 0.69, shows the assumed design evaporation allowances to be on the high or conservative side.

The maximum ordinate between the mass curve and the draft curve is 6,900 mil.gal., the required storage.

Figure 4 shows the mass and draft curves.

Table 2 shows the comparison between the design evaporation allowances and the U.S. Weather Bureau's Indianapolis evaporation station actual observed pan evaporation, translated into equivalent pond evaporation.

Area and capacity curves for the basin were constructed by measuring the areas at various elevations on the topographical maps. These curves, (Fig. 5), show that, to provide 6,900-mil.gal. storage, the required crest ele-

vation of the dam spillway would need to be 785 ft. In like manner, the water area of a full reservoir at el. 785 is (from area curve) about 1,800 acres.

The site of the dam was chosen at a narrow point in the valley where the valley floor is about el. 759. Therefore, the required height of the spillway structure was found to be 26 ft. above the valley floor. Subsurface borings made on and near the proposed axis of the dam disclosed the hillside to be glacial till, composed largely of clay, with some scattered pebbles. The valley bottom under the loam topsoil is a sedimentary deposit of sand and gravel. Bedrock (limestone) on the north side of the existing creek was found at 53 ft. below the valley floor. Immediately upon crossing to the south side of the creek, the bedrock was found to take a very pronounced strike

or inclination to the south and, at a point 500 ft. south of the creek, the rock was found at 87 ft. below the valley floor. The subsurface investigations were made by the water company's own forces.

In 1932, after the subsurface investigations had been made, W. N. Logan, then Indiana State Geologist, was consulted regarding the geology of the proposed dam site. Logan explained that a preglacial gorge had been cut into the limestone bedrock, the channel or channels of which probably have no relationship to the present drainage channel. This gorge probably included the present location of White River, and might have been as much as 6 or 8 mi. wide. Evidently one of the channels in this gorge passed through some distance to the south of the present Fall Creek drainage, which, at the proposed dam site, happened to

be just on the north edge of that low channel. This explains the dip of the rock surface to the south disclosed by the borings.

The sand and gravel above the bedrock are a glacial deposit and fill the entire preglacial gorge, probably to about the elevation shown by the borings at the dam site. Needless to say, the whole country in that vicinity is underlain with this sand and gravel deposit, probably for the whole width of the preglacial gorge. Logan explained that the clay hillside material was formed from wind-blown material from the glacier or from the glacial drift, afterwards brought to its present topography by erosion.

Logan was of the opinion that (1) the seepage from the proposed dam would not be serious because of the fairly thick blanket of fine material overlying the sand and gravel deposit;

(2) the underflow through the sand and gravel bed partially controlled, as provided for by the design features of the dam, would not be of such quantity as to be serious; (3) much of this underflow is unlikely to escape to the south, even though the bedrock drops in that direction, as that underground reservoir is now filled with water and as the old gorge probably heads back

towards the present Fall Creek drainage farther downstream; and (4) the clay material in the hillsides would probably be suitable for embankment material since it is practically impervious to water.

### Design of Dam

The geology at the site of the dam dictated an earth-fill structure. An

FIG. 5. Area and Capacity Curves

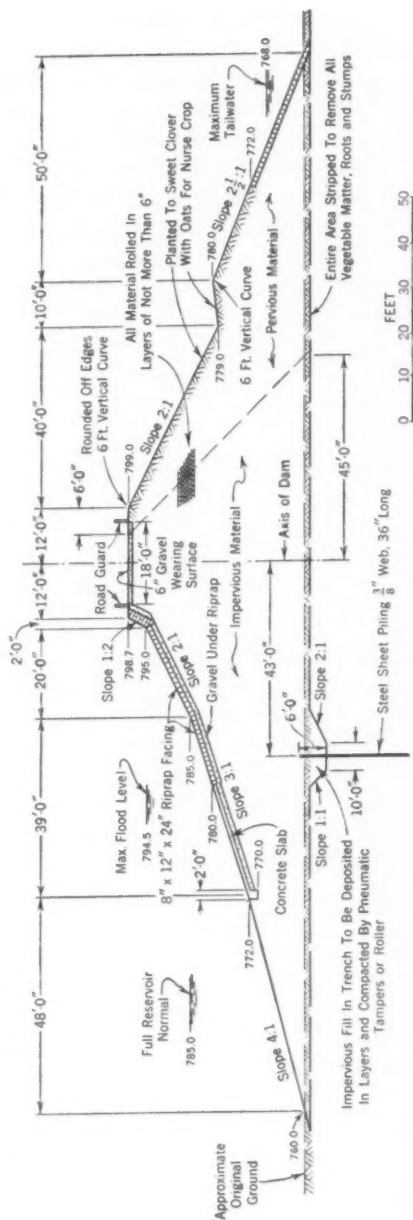

FIG. 6. *Above*, Plan of Giedt Reservoir Earthenfill Dam; *Below*, Typical Cross-Section

abundance of clay was available at the site with which to construct the impervious portion of the earth fill. A gravel deposit from which the pervious portion of the structure could be made was available in abundant quantities within economical hauling distance of the site. It was considered uneconomical to carry the foundations of the dam to bedrock because of its excessive depth. Therefore, the earth-fill structure was built on the valley floor and a steel sheet piling cutoff wall extending across the valley was provided to reduce the flow under the dam to an amount which would not be harmful to the structure or to the reservoir operating requirements. Inasmuch as the existing channel of Fall Creek is used to convey impounded water from the reservoir to the purification plant, percolation is of little or no significance, since it is utilized at the purification plant as useful raw water.

The length of the dam at its top elevation from hillside to hillside is approximately 1,900 ft., the central portion of which is a concrete spillway 500 ft. long. The top width of the earth embankment is 24 ft. Various slopes from 4 to 1 to 2 to 1 were used on the upstream side of the embankment. The flatter slopes on the upstream face of the embankment were selected to obtain stability when completely saturated under the reservoir water level and the steeper slopes near the top of the embankment were selected in the interest of economy, since these upper portions are not so often saturated. The downstream slope of the dam is composed of two slopes with an intermediate berm, the bottom slope being 2.5 to 1 up to the point of a safe freeboard above maximum tail-water elevation and the upper slope is made 2 to 1 in the interest of economy.

The berm on the downstream slope serves to obtain the necessary width of the embankment at the lower levels and to break up water drainage on the downstream slope from the top of the dam to the valley floor. The upstream slope of the embankment is protected against washing or wave action by reinforced concrete slabs and precast concrete revetment blocks, laid loose and without mortar. Gravel, 12 in. in thickness, was placed underneath the upstream slope revetment for drainage purposes.

The embankment itself is composed of two kinds of material—impervious material in the approximate two-thirds of the structure which is upstream, and pervious material in the downstream third. The former has a very high degree of imperviousness and, consequently, the amount of water seeping through this portion of the embankment is inconsequential. Since the downstream one-third of the embankment is composed of a highly pervious gravel, any water reaching this point is rapidly conducted away with a consequent lowering of the hydraulic gradient, so that when this water reaches the downstream toe of the embankment, it is below the valley floor level.

Inasmuch as the dam is built on a pervious deposit of considerable thickness between the valley floor and the bedrock, the major problem in the design of the earth-fill embankment was to reduce the amount of flow under the dam to that quantity which provides complete safety to the embankment structure as well as to that quantity which would be less than the minimum amount of required draft from the reservoir at any one time. The problem was solved by using a steel sheet piling cutoff wall driven below

FIG. 7. Geist Reservoir Earthfill Dam

the valley floor. Water passing under the dam must travel through the pervious valley material under the dam to the cutoff wall and then vertically downward and back up under before passing on downstream.

Figure 6 shows the plan of the dam and a typical cross-section of the earth embankment. Figure 7 is a photographic view of the dam.

#### *Spillway Structure*

Studies were made to determine the estimated required discharge capacity of the spillway that would safely pass any and all expected floods without overtopping the dam. The greatest flood on record in this part of the Middlewest occurred in 1913. Known high-water elevations of this flood, together with cross-sections of the valley and measured flows of later and smaller floods, provided the data for determining the magnitude of the 1913 flood. This was estimated to be 20,000 cfs. at the dam site. The study also indicated the possibility of a maximum flood of 50,000 cfs. on this stream and the spillway was designed to pass this flood flow. The length of the spillway was made 500 ft. The spillway structure from its base at el. 750 to the crest at el. 785 is mass concrete and the shape of the structure is made to fit tightly against the under side of the

falling sheet of water. This feature allows a somewhat higher coefficient of discharge to be used in the Francis wier formula than would be the case if entry of air to the under side of the falling sheet were permitted. The coefficient of discharge at the design head was chosen as 3.8. Using this coefficient, the head required to pass the maximum flood is 9.5 ft.; and the head required to pass a repetition of the 1913 flood is approximately 5.0 ft. To provide a safe freeboard, the top of the earth dam was made 14 ft. above the spillway crest.

Stability analyses of the spillway structure indicated the use of piling to support the spillway. Because proper timber is readily available in the vicinity of Indianapolis, wood piling was used.

#### *Abutment Walls*

The abutment walls retaining the earth embankments at each end of the spillway structure were designed as reinforced concrete cantilever sections. These have a maximum height of 49 ft. They were designed to resist dry earth pressure from the top of the dam to the saturation line and full hydrostatic water pressure below that point. The highest wall section has a footing thickness at the back of the vertical stem of  $6\frac{1}{2}$  ft., and a maximum thickness of the stem at the top of the footing of 5

Str  
Slope  
1:1

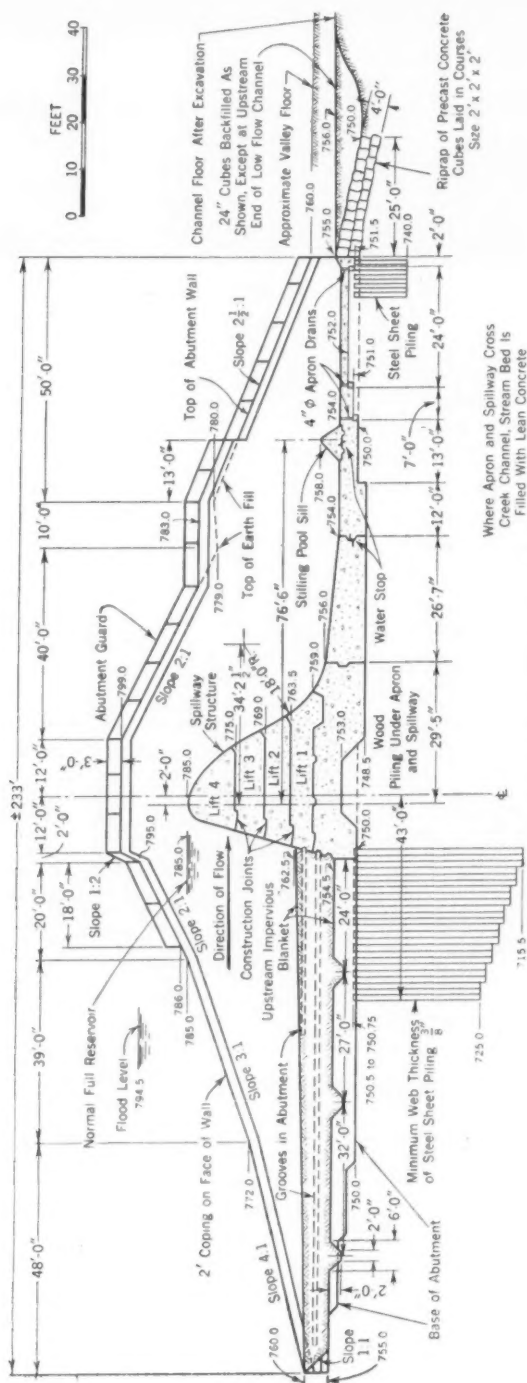

FIG. 8. Cross-Sections of North Abutment Wall, Showing Piping Tunnel

ft.  $\frac{1}{2}$  in. This is probably one of the highest reinforced cantilever walls in the Middlewest. The walls were constructed with scoring on the back and with concrete fins to deter water from passing along the back of the wall at the contact plane with the earth embankment. The maximum main reinforcing used in these walls is 1 $\frac{1}{4}$ -in. square bars at 5 $\frac{1}{2}$  in. on centers in two layers.

Figure 8 shows two cross-sections of the north abutment wall.

#### *Stilling Pool and Apron*

The energy resulting from the high velocity of the falling sheet of water at the foot of the spillway is dissipated by means of the hydraulic jump. The jump occurs when the flow is discharged into a stilling pool at the foot of the spillway. After the discharge from the spillway passes through the hydraulic jump, it is then delivered downstream at a safe velocity over the apron to the creek channel below the dam. The floor of the stilling pool and the apron is made of plain concrete of sufficient thickness to resist uplift safely. Underdrains of 4-in. pipe were placed in that portion of the apron downstream from the stilling pool sill to relieve uplift.

A model of one of the preliminary designs of the spillway, pool and apron was constructed and was tested at the Fort Collins Hydraulic Laboratory of the U.S. Bureau of Reclamation. The test of this preliminary design revealed some erosive action taking place downstream from the end of the apron. The model was revised by a slight change in the lip of the downstream edge of the apron, a slight rounding of the upstream top edge of the stilling pool sill, and some shortening of the length of the apron. The model was

tested again and the erosive action taking place in the first case was found to have been eliminated. In fact, the discharging water was actually transporting material upstream from the creek bed below the dam and depositing it on the apron at the stilling pool sill. That the prototype will perform in similar fashion to the model is indicated by the fact that a small amount of deposition of material on the downstream portion of the apron took place during the May 1943 flood. The flow of this flood amounted to about 9,000 cfs. It is believed that model studies are invaluable as an aid to the design of a structure of this sort.

Figure 9 shows a section through the spillway.

#### *Outlet Works*

The outlet works consist of an intake structure, outlet piping and an outlet structure. These structures are built into and are a part of the north abutment. The intake structure is a reinforced concrete pit 44 ft. high, approximately 15 ft.  $\times$  17 ft. in horizontal cross-section, provided with racks, stop plank grooves and sluice gates permitting withdrawal of water from two different levels of the reservoir. An outlet sluice gate is provided at the end of the outlet piping. The screening racks may be removed and replaced by means of a hand-operated chain hoist, suspended from a trolley beam supporting structure on top of the intake structure. This chain hoist mechanism may also be used to install or remove stop planks in the grooves immediately behind the racks. The stop planks are kept in a storage box constructed as a part of the intake structure and they may be used at times when it is desired to dewater the intake structure in case of necessary re-

pairs to or removal of any of the sluice gates. The two sluice gates at the inlet ports of the intake structure are 48 in.  $\times$  60 in. rectangular, gates being raised and lowered by means of a hand-operated stand on top of the structure. The sluice gate at the head of the outlet piping is a 54-in. circular gate operated in the same manner. The outlet piping, which carries the water from the intake structure downstream to the outlet structure, is 48-in. cast-iron piping in a reinforced concrete tunnel under the earth embankment. This tunnel is shown in Fig. 8 which also shows the maximum abutment wall section. The tunnel section is an unsymmetrical arch, springing from the back of the vertical stem of the abutment wall and from the top of the footing slab. The outlet piping (Fig. 8) is supported on concrete piers bearing on the top surface of the abutment wall footing slab. The tunnel allows inspection, as well as repair and maintenance, of the outlet piping, and is accessible from the valve chamber of the outlet structure.

The outlet structure is made of reinforced concrete and is a part of the north abutment wall. It is divided into two pits or chambers, the most upstream one being the valve pit and the downstream one being the discharge point of the water. In the valve pit portion of the outlet structure is installed a 36-in. cone valve in the 48-in. outlet piping line. This cone valve is regulated by a hand-operated stand on top of the structure. The cone valve is used for normal regulation of flow from the reservoir. The water pit of the structure has two issuing ports in its front wall, each 48 in. by 60 in., and these two ports straddle the stilling pool sill. Thus, water withdrawn from the reservoir may be discharged into

the stilling pool, which is the ordinary method of operation, or it may be discharged directly to the apron immediately below the pool. These outlet ports are covered by manually operated rectangular sluice gates, similar to those used in the intake structure.

The elevation of the invert of the outlet piping is 756.75 ft. The volume of the reservoir above this elevation is 6,880 mil.gal. Since the capacity of the full reservoir is 6,900 mil.gal., there is only 20 mil.gal., or 0.3 per cent of the reservoir capacity, which is unavailable.

Gages are provided at various points so that the flow is known for operating and record purposes. An automatic recording gage is located at the upstream end of the reservoir and measures the creek inflow. Chain gages and known elevation points on the new bridges of the roads crossing the reservoir are available for determining the reservoir level and backwater elevations at flood time. Another automatic recording gage, which records the level of the water in the reservoir, is provided at the intake structure at the dam. At the outlet structure, another automatic gage provides a continuous record of the water level in the stilling pool. Near the center of the 500-ft. length of the stilling pool sill, a weir notch or depression 20 ft. long and 1 ft. deep has been constructed. The discharge from this weir notch has been measured at various times by a current meter, by gaging at a point downstream from the apron, and these measured discharges have been plotted in terms of stilling pool gage heights. Thus, the simple notch in the top of the stilling pool sill and an automatic water level recording gage is the meter or means of measuring the outflow from the reservoir. This weir notch,

after it has once been rated, is never subject to change in the calibration; therefore, a continuous accurate record of the water leaving the reservoir is available. The gaging station located at Millersville, which was previously referred to, continues in use. The flow measured at this point, when compared with the flow measured at the dam, indicates the amount of pick-up from tributary watershed area between the dam and the purification plant.

### *Design of Roads and Bridges*

Approximately  $3\frac{1}{2}$  mi. of existing township and county roads were inundated by the new impounding reservoir. On these roads, crossing Fall Creek, were four bridges. These bridges were too low for the new reservoir water level. Consequently, the bridges were removed and  $7\frac{1}{2}$  mi. of roads were vacated.

New roads were constructed by the water company on high ground along the margin of the reservoir to replace the roads that had been flooded. Two new modern bridges were constructed to provide means for the public to travel from one side of the reservoir to the other. An existing through truss steel bridge near the upper end of the reservoir was raised approximately  $2\frac{3}{4}$  ft. to provide the same clearance above the backwater as the bridge had above natural stream level before the reservoir was constructed.

The new roads were constructed with a roadway surface 22 ft. wide, with 7-ft. berms on each side, and with 2 to 1 slopes on fills and in cuts. Maximum grades were 3.5 per cent and the maximum curvature was 4 deg. The roads were equipped with modern drainage structures and guard rails. The section and class of construction is approximately the same as

used by the Indiana State Highway Commission for primary roads, except that the roadway was surfaced with gravel instead of concrete or other pavement material.

The new bridges are of the reinforced concrete slab and girder type, supported by cantilever abutments and piers. The abutments and piers are supported by wood piling. One of the new bridges has four 40-ft. clear spans and the other has five 40-ft. spans. The approaches to the bridges are earth fills with 38-ft. top width and the side slopes are riprapped with precast concrete blocks to prevent erosion by waves.

The bridges were designed to pass a flow of 20,000 cfs. The mean velocity of the water passing through one bridge opening for a 20,000-cfs. flood flow is 6 fps., and through the waterway of the other bridge, the mean velocity is 5.5 fps. The backwater curve for the reservoir surface, for a repetition of the 1913 flood, was computed and the bridges were constructed with a clearance above this water level of 4 ft. The tops of the approach fills have a freeboard of 1 ft. above this flood elevation.

### **Construction of Dam**

Construction of the dam began on May 26, 1941.

Clearing the area to be occupied by the dam of all timber, brush, sod and vegetation was the first work done at the site. After clearing and stripping had been completed, excavation was started in the area to be occupied by the 500-ft. spillway and the abutment walls. The well point method was used to dewater the excavated areas. The dewatering system at the area to be occupied by the footing of each abutment consisted of a 6-in. suction header,

with 1½-in. well points spaced at 5 ft. on centers and each connected to the suction header with the usual flexible rubber hose connection. The well points were all jetted into place. Two 2,000-gpm. centrifugal pumps were used on each suction header loop and this system effectively lowered the water level to well below the subgrade level of the proposed construction.

The same well point system was used to dewater the area occupied by the spillway structure and the apron.

As soon as the excavation had been completed to grade, wood pile driving began. The piles varied in length from 10 to 48 ft. and various subsurface conditions were encountered while the piling was being driven. To secure the required design loads, it was found necessary to vary the spacing of the wood piling in several instances. In some locations, wood pilings were successfully driven with a spacing of 2½-ft. centers each way. Before this unusually close spacing was adopted, a cluster of piles was driven with this minimum spacing and reference points were placed on central piles of the group. The distance between reference points was observed while surrounding piles were being driven, to make sure that there was no lateral displacement while driving. Approximately 80,000 lin.ft. of wood piling was driven on the job. The contractor used both double- and single-action steam hammers. The *Engineering News-Record* formula\* was used to determine the safe bearing load of each

\* This formula is:

$$P = \frac{2Wh}{s + c}$$

where  $P$  = safe bearing load of pile, lb.;  $W$  = weight of hammer, lb.;  $h$  = drop of hammer, ft.;  $s$  = penetration of pile under last blow of hammer, in.; and  $c$  = 1.0 for a drop hammer and 0.1 for a steam hammer.

pile as it was being driven. Loads secured varied from 14,000 to 156,000 lb. per pile.

While wood piling for the structures was being driven, installation of the steel sheet piling cutoff wall was in progress. A trench was cut with a drag line on the line of the cutoff wall and the steel sheet piling was driven into this trench. Double-action steam hammers were used for driving the piling.

After the wood piling and steel sheet piling under the abutments had been driven, forming was started for the abutment footings, the reinforcing steel was installed and the footings were concreted. The lower mat of reinforcing steel in the abutment footing was supported by chairs on top of the wood piles. The upper mat of reinforcing steel was installed on special bents. After the steel had been installed, wood piles were used as beams to span from one side of the form to the other, and the weight of the top mat of reinforcing steel was picked up and suspended from these beams and the temporary wood bents were then removed from under the steel.

Plywood was used in forming the exposed faces of the abutment walls and the downstream face of the spillway structure proper. One-inch lumber was used on all other unexposed concrete. No concrete was rubbed. Patented form ties were used throughout on all form construction.

All the concrete was mixed at the job. The concrete used in reinforced structures was made with 1-in. maximum size aggregate, 1.25 bbl. minimum cement content per yard, and a water-cement ratio not exceeding 6.6 gal. per bag of cement.

Mass concrete used for the spillway structure base, the spillway structure

proper and the apron was made with 2-in. maximum aggregate size. The minimum cement content was 1.2 bbl. per cu.yd. and the water-cement ratio was not more than 6.6 gal. per bag of cement. A concrete testing laboratory was set up in the field and close supervision was exercised over the concrete operations. Laboratory trial mixes were made before any concrete was placed and these trial mixes were modified slightly after the work had started. During concreting operations, samples were taken and analyses were made of the water content of the mix, slump and workability. Cement testing was done at the manufacturer's mill. Compression cylinders were made throughout the job and these cylinders were tested sometimes at seven days, but usually at 28 days, after curing in the laboratory. Standard Portland cement was used for all the reinforced concrete structures and for the first section of spillway structure. Modified low-heat-content cement was used for all other mass concrete structures. Concrete densities from 149 lb. per cu.ft. to 159 lb. per cu.ft. were obtained. The average compressive strength of all cylinders tested was 4,475 psi. for reinforced concrete and 4,140 psi. for plain (mass) concrete.

The contractor set up the batching plant and aggregate storage pile on the high ground at the north end of the dam. Here the aggregates were batched into dump trucks (capacity 2 cu.yd.) and hauled down to the point where concreting was in progress. On the trip down from the batching plant, the truck stopped at the cement storage house where the cement was added. The cement used was secured in bags. Mixing was done with a 1-cu.yd. pavement mixer operating at the concreting point. The batch trucks backed up and

discharged their batches into the skip of the mixer and, after the batch had been discharged into the mixer and mixed for one minute, it was discharged into a 1-cu.yd. bucket. The concrete was placed with the 1-cu.yd. bottom dump bucket handled by a crane. Maximum concrete production with this plant reached 40 cu.yd. per hour. All concrete was placed in the forms by means of vibrators.

All concrete was cured by being covered with burlap which was kept continuously wet for a period of fourteen days.

While concreting these structures, considerable knowledge was gained regarding internal and face temperatures of the setting concrete (Fig. 10). In December 1941, the first section of spillway structure was concreted as a monolith. This monolith contained 813 cu.yd. of concrete and was approximately 26 ft. high and 40 ft. long. The concrete was completed in 27 hours of continuous pouring time. Standard Portland cement was used and the average placing temperature of the fresh concrete was 62°F. Thermometers were suspended in pipe wells in the interior of this block of concrete so that the internal temperature could be observed, and they also were set in wells immediately inside the face of the forms so that temperature readings representing the face temperature of the concrete could be secured. At the end of two days, the internal temperature was 140°F. or, in other words, a temperature rise above the placing temperature of 78°F. Face temperatures reached a maximum of 95°F. and the internal temperature, after three weeks' time, was still 112°F. The outside air temperature varied during this period from -7°F. to 51°F. The forms were removed from this monolith 27 days

after concreting, and the block of concrete was found to have cracked vertically from top to bottom at about its mid-point. Construction joints were provided in the spillway structure at 40-ft. intervals; therefore, the crack which occurred in the first section concreted was not disastrous but merely represented another construction joint. After this experience, the method of concreting the spillway section was changed as follows:

1. Modified low-heat-content cement was used instead of standard Portland cement.

2. The vertical height was concreted in four lifts.

3. The concrete was placed with a temperature as low as possible without containing frost or frozen lumps.

After the new scheme of concreting had been adopted and placed in operation, no further cracking of mass concrete resulted. Alternate concrete lifts were poured in order to allow the ones previously concreted to cool before adding other additional lifts. This revised method of concreting reduced the temperature rise to approximately 35° F., and, by placing the concrete at temperatures as low as possible, in one case 46°F., the maximum internal temperature was 73°F. The top surface of each previously concreted lift was prepared by wire brushing when about one day old in order to roughen up the surface and promote bond with the new concrete. Before placing new concrete on the top surface of the old lift, the old concrete was covered to a depth of approximately 1 in. with grout composed of the same quantities of cement and sand used in the concrete mix. This grout mixture was spread and brushed on the roughened area of the concrete by using brooms and fiber brushes with stiff bristles.

### *Embankment Placing*

After the cutoff wall and the abutment walls were completed, embankment placing was started. The main embankment for the the dam, as heretofore mentioned, consisted of impervious clay in the upstream two-thirds of the section, and pervious gravel in the downstream one-third. Placing impervious clay and gravel was done at the same time so that the level of both materials was about the same. The gravel was excavated from a glacial deposit near the center of the valley, about 2½ mi. upstream from the dam, and was trucked to the dam site by dump trucks. The clay was secured from borrow pits on the hillsides at each end of the dam and was excavated and transported to its final location with LeTourneau Carryall scrapers pulled by Caterpillar D-8 tractors. Approximately 114,000 cu.yd. of clay embankment was placed. The contractor, by using four LeTourneau Carryalls, was able at times to place as much as 5,000 cu.yd. of this material per day. Specifications provided that the material should be placed in layers not exceeding 7 in. in thickness when loose and compacted with ten passes of a sheep's foot roller, creating a pressure of 250 psi. of surface area on the bearing feet. The LeTourneau Carryalls roughly spread the material, and a bulldozer was used to spread the freshly placed layer uniformly. The bulldozer also pulled the sheep's foot rollers, two of which were used connected in tandem, and, therefore, one operator was able to spread and roll the freshly placed layer in one operation.

A laboratory was set up in the field so that soil tests could be made with which to supervise and control the impervious clay placing and compacting

FIG. 10. Temperatures of Poured Spillway Mass Concrete

FIG. 11. Proctor Test of Impervious Material Sample From Borrow Pit

operations. Proctor tests were made on the material at many points in the borrow pit before it was excavated, and after the material had been rolled samples were taken to determine the density and degree of compaction.

Figure 11 is a diagram showing the Proctor test of one of the samples from the borrow pit. This diagram shows that for this material the original moisture content was 9.5 per cent although the optimum moisture content was 11 per cent, and the wet weight or density of the material could be made 141.4 lb. per cu.ft. The percentage of air voids at maximum wet weight was 3 per cent. The data obtained from the Proctor tests of the samples taken from the borrow pits before excavation were plotted on a map of the borrow pit

areas so that the results of the embankment samples could be co-ordinated with the laboratory tests of the samples taken from the borrow pit areas.

During placing operations samples of the fill were taken so that the degree of compaction being secured could be determined. Since the impervious clay material was a glacial till and contained pebbles of various sizes, a known volume container could not be used to secure the samples from the embankment. A known volume of material from the embankment was secured by digging a hole in the embankment and filling it with a volume of sand, which had previously been dried in the laboratory to a constant weight. The weight of the sand required to fill the hole to a strike-off board allowed the volume of the embankment material removed from the hole to be determined. The embankment sample removed from the hole was taken to the laboratory and there processed so that its density and other pertinent data could be determined. Densities of samples taken from the embankment varied from 110 to 146 lb. per cu.ft.

It was found that the material as it existed in its natural state in the borrow pit contained very nearly the optimum amount of moisture and no sprinkling was needed or required throughout the embankment placing operations. However, on rainy days, it was necessary to allow the embankment to dry sufficiently before resuming placing operations.

### Construction of Roads and Bridges

No unusual problems were encountered in construction of the roads and bridges. The earthwork was done by LeTourneau Carryalls, and clearing of the right-of-way was done by Cater-

piller D-8 bulldozers. Pile driving, forming and concreting were done in the usual manner.

Riprap blocks made of precast concrete, each 10 in.  $\times$  10 in.  $\times$  24 in., were used on the slopes of the approaches to the bridges, as protection against wave erosion. The blocks were made and handled by the contractor in a novel manner. Pavement forms were installed on an area previously graded level and these forms were divided into compartments having the same dimensions as the blocks. The concrete was placed by a pavement type mixer. Before the concrete had set up, a wire loop was placed in each block compartment, so that the blocks could be lifted later. The forms were dismantled after the concrete had hardened sufficiently and the blocks were removed from the forms by a crane using a sling on which were suspended short lengths of chain, with hooks. To lift, the hooks on the ends of the chains were fastened into the wire loops previously cast in the individual concrete blocks. Seven of the blocks were lifted simultaneously by the crane and were loaded on a truck. After the truck had delivered the blocks to the point of placing, a crane with a similar sling with suspended hooks was used to lift the blocks from the truck and place them on the slopes of the fills. Approximately 95,000 of these blocks were made and used on the slopes of the two roads crossing the reservoir.

#### *Clearing*

The entire area (1,800 acres), inundated by full reservoir, was cleared of all buildings, fences, existing road bridges and other structures, timber, brush and high weeds. Buildings were sold and, for the most part, were re-

moved from the premises by the purchaser. The clearing contractor's work consisted of removing the debris at the building sites, filling wells and privy vaults, removing fences, timber and brush and burning weeds. Clean-up around the building sites was done by Caterpillar D-8 bulldozers and the fence was removed by the same equipment. Existing county road bridges were match-marked, dismantled and delivered to the county highway department yards. Of the 1,800 acres cleared, approximately 535 acres were wooded and the rest were cultivated fields and pasture with scattered trees. Trees were felled by two-man-operated cross-cut saws. The logs were dragged to central points by tractors. At the central points workmen trimmed the branches off the logs and those logs which had commercial value were sold to lumber dealers. Logs without commercial value, and branches, limbs and brush were piled by a crane and burned. After the disposal of brush and timber was completed, the entire area was burned over in order to reduce the vegetation taste of the newly stored water.

#### **Stream Diversion and Reservoir Filling**

On Aug. 6, 1942, construction work at the dam, road crossings and the clearing had progressed sufficiently to allow the stream flow to be diverted from its original channel at the dam. The stream was caused to flow through the permanent outlet piping at a time of low stream flow. After diversion, the remaining 80-ft. length of the spillway structure was installed rapidly. On Dec. 22, 1942, increased stream flow caused the reservoir to begin filling in spite of the fact that the outlet

pipings was discharging at full capacity. Existing county road bridge removal was under way at this time. Fortunately, the bridge removal work was completed ahead of the rising water in every case. By Dec. 29, 1942, bridge removal work had progressed sufficiently to allow the valve in the outlet piping to be closed and thus store all the available water. On Mar. 17, 1943, the rising water reached spillway crest level and first flow over the spillway began. Three days later, full stream flow was passing over the spillway.

#### *Flood Flow—March 1943*

As a result of spring rains, a flood flow occurred over the completed spillway on May 18, 1943. This flood created a head of 3.0 ft. on the 500-ft. length of the spillway and amounted to approximately 9,000 cfs. The spillway and its stilling pool performed as expected and the flood flow was delivered to the valley downstream with relatively low velocity. No scouring at the end of the apron occurred; in fact, the spillway performed in the manner in which the model studies had indicated it would. Gravel was eroded from the valley floor at a safe distance below the dam and a certain amount of this material was carried up-

stream and deposited on the downstream apron.

#### *Seepage Under the Dam*

Before completion of construction, flow nets were prepared and a study was made to estimate the expected seepage under the dam. It was estimated that the seepage would probably amount to about 5 cfs. Several seepage measurements were made during the summer of 1943 when no flow was occurring over the spillway. These measurements varied from 3.5 to 3.7 cfs., the average being 3.6 cfs.

#### **Acknowledgments**

Plans, design and supervision were carried out by the Engineering Staff of the Indianapolis Water Company, under the direction of W. C. Mabee, Chief Engineer, now retired. Plans, specifications, design features and part of the construction work were reviewed by the late Charles H. Paul, Consulting Engineer. C. C. Chambers, Consulting Engineer, reviewed the construction work after Mr. Paul's death. H. S. R. McCurdy, former Chief Engineer of the Philadelphia Suburban Water Company, also reviewed the design features.

# Standard Methods for the Examination of Water and Sewage

## Summary of Recommended Changes for the Ninth Edition

By John F. Norton

Chairman, Joint Editorial Com., Standard Methods for the Examination of Water and Sewage

A contribution to the Journal

IN preparing the manuscript for the ninth edition of *Standard Methods for the Examination of Water and Sewage*, it was evident to the Joint Editorial Committee that a rather comprehensive revision, both in organization of material and of procedures, was desirable. Since no member of the committee was in a position to undertake such a revision, the American Public Health Association and the American Water Works Association, on recommendation of the Joint Editorial Committee, asked George E. Symons, Associate Editor of *Water Works and Sewage*, to serve as editorial consultant. Dr. Symons has been at work on this revision for the past ten months. The manuscript is now complete, except for minor editorial changes. All portions have been submitted, after editing, for approval to at least one member of the committee and in some cases the proposed text has been resubmitted to special committees which had prepared the original material. The methods for sewage examination were prepared by a special committee of the Federation of Sewage Works Associations and approved by the Board of Control of that association for inclusion in *Standard Methods*. Only such changes as were nec-

essary for conformance to the style of *Standard Methods* have been made in these methods.

The following summary of changes and additions for this ninth edition has been prepared by Dr. Symons.

### A. Organization and Format

Part I includes physical and chemical methods for water analysis. These methods have been arranged independently of the type of water being analyzed. Persons interested in special types of water will find the suitable methods under the appropriate constituent for which assay is required.

Part II contains methods for the examination of sewage, sewage effluents, sludges, muds and industrial wastes. Part III includes microscopic examinations. Part IV contains bacteriological methods.

Some of the procedures listed in Appendix I (Non-standard Methods) of the eighth edition have been included as standard procedures, a few have been deleted, and a few added. Appendix II contains a new list of American Chemical Society Reagent Grade Chemicals and a new section in which are found directions for making the more common laboratory reagents. This eliminates unnecessary repetition

in the text. Directions for making special reagents are given in the main text.

The bibliographies have been revised and articles on which a method is based are listed in chronological order at the end of each section. Reference numbers have been eliminated. Cross references now include page numbers as well as parts and sections. Formulas for calculating results are included in each determination. The Index has been revised and enlarged.

## B. Revision of Methods

### *Part I—Examination of Water—Physical and Chemical*

*Oxygen consumed:* Omitted.

*Odor:* Completely revised.

*Hardness:* Palmitate method added.

*pH:* Glass electrode method added.

*Carbon dioxide:* Includes evolution technic and new table and graph for calculation from ionic activities.

*Bicarbonate ion:* Formulas for calculation.

*Carbonate ion: hydroxyl ion:* Precipitation methods and formulas for calculation.

*Oil:* Evaporation and extraction, or wet extraction.

*Silica:* Variations of colorimetric method added.

*Arsenic:* (New) Gutzeit method.

*Aluminum:* Colorimetric method using aurin-tricarboxylic acid.

*Iron:* Bipyridine and phenanthroline colorimetric methods added.

*Chromium:* (New) Colorimetric method using diphenylcarbazide.

*Zinc:* Nephelometric method only.

*Calcium:* Revised.

*Magnesium:* Titan yellow method added.

*Sodium:* Uranyl zinc acetate reagent.

*Potassium:* Colorimetric method added, using sodium cobaltinitrite and potassium dichromate.

*Chloride:* Both Volhard and Mohr methods.

*Fluoride:* Scott modification of Sanchis's Method [A.W.W.A. Committee Report. Jour. A.W.W.A. **33**: 1965 (1941)].

*Ortho-phosphate:* (New) Gravimetric and colorimetric using aminonaphtholsulfonic acid or stannous chloride.

*Pyro-phosphate:* (New) Manganous chloride separation or difference method.

*Meta-phosphate:* (New) Barium chloride separation or difference method.

*Boron:* Electrometric titration.

*Cyanide:* Colorimetric, using yellow ammonium sulfide.

*Tannin and Lignin:* (New) Colorimetric or photometric using phosphotungstic or phosphomolybdic acids.

*Residual Chlorine:* Completely revised by A.W.W.A. Committee [Jour. A.W.W.A., **35**: 1315 (1943)], including ortho-tolidine method, iodometric method, ortho-tolidine-arsenite method and drop dilution method for field use.

*Chlorine Demand:* Two methods, one for laboratory use and one for field use [A.W.W.A. Committee Report. Jour. A.W.W.A., **35**: 1315 (1943)].

*Dissolved Oxygen:* Revised.

*Hydrogen-Sulfide:* Evolution or colorimetric method or calculation from pH.

*Methane:* (New) Gasometric method.

*Part II: Sewage, Sewage Effluents, Industrial Wastes, Polluted Waters, Sludges and Muds*

The revision by the Committee of the Federation of Sewage Works Associations contains these significant changes:

*Albuminoid Nitrogen:* Deleted.

*Organic or Total Nitrogen:* Distillation into boric acid.

*Nitrate Nitrogen:* Revised to include technics for industrial wastes, and colored sewages.

*Dissolved Oxygen:* Completely revised, Alsterberg and alum flocculation method added. Dissolved oxygen in activated sludge added.

*Oxygen Consumed:* Procedure for brine and strong sewage added.

*Biochemical Oxygen Demand:* Standard dilution water, procedure for chlorinated sewage and dilution method for sludges and muds added.

*Residue or Solids:* New method for settleable solids:

*pH:* Glass electrode new standard.

*Residual Chlorine:* Revised to conform to technic for water, ortho-tolidine, starch iodide methods; spot plate test for field use.

*Chlorine Demand:* Conforms to technic for water.

*Sulfides:* Methylene blue colorimetric method added.

*Grease:* New extraction technic using petroleum ether.

*Solids in Activated Sludge:*  
(New) Aluminum dish method.

*Part III. Microscopical Examination of Water, Sewage Sludge and Bottom Sediments*

This has been revised and rewritten. New equipment and new forms for reporting results are included.

*Part IV. Bacteriological Examination of Water*

Tryptone glucose agar has been added as a plating medium, and lauryl sulfate tryptose broth for coliform test. Fuchsin broth and formate ricinoleate broth have been deleted as confirmatory media. The schematic outlines have been revised, as has the section on coliform density. Bacteriological examination of water from swimming pools is included as a standard method. The Eijkman test has been added to the section on differentiation.

**Appendix I: Non-Standard Methods**

New sections introduced into the Non-standard Methods include Chromium, Selenium, Volatile Acids in Digested Sludge, Oxygen Demand and Activity of Activated Sludge, Grease in Sewage Sludge (by wet extraction and by extraction of coagulated sludge), and Colorimetric pH of Sewage and Sludge.

Revised sections in Appendix I include Phenols in Water, British Bacteriological Practice and Organic Carbon in Sewage. Other sections taken from the eighth edition include pH Buffers and Indicators, Lead and Phenols in Streams.

# Norwich, New York—Survival and Retirement Experience With Water Works Facilities

As of December 31, 1940

THE Norwich plant of the New York Water Service Corporation renders water service to the city of Norwich, N.Y., and adjacent areas in the town of Norwich.

Norwich, the county seat of Chenango County, is located in the south central part of the state, about 55 mi. southeast of Syracuse. The Chenango River flows through the city. It is a local trading center, largely residential but with some small industries.

As of Dec. 31, 1940, there were 2,119 metered customers being served by the

plant in a territory having a population of about 8,800 people. Consumption during the year averaged approximately 0.52 mgd., equivalent to 59 gpd. per capita.

## Development of the Existing System

The original plant was incorporated as the Norwich Water Works in January 1881. The works were constructed during that year and water service commenced a year later. In 1926 the New York Water Service Corporation acquired the Norwich Water Works

cated in the town of Norwich about  $1\frac{1}{4}$  mi. northeast of the city. A reservoir, now known as Lower Reservoir No. 1, having a surface area of 6.5 acres, was formed by an earthen dam approximately 40 ft. high and 240 ft. long, receiving the drainage from 4 sq.mi. of watershed. Water was fed, without other treatment than natural settlement, through a 12-in. cast-iron main, approximately 6,500 ft. long, to the distribution system.

During 1890 and 1891, additional impoundment became necessary and a

second, or upper Reservoir No. 2, was built east of the original reservoir. The new reservoir has a surface area of 9 acres formed by a 50-ft. earthen dam, 612 ft. long, 54 ft. in elevation above Reservoir No. 1. The 12-in. transmission main was extended to Reservoir No. 2, but generally the discharge is from the upper reservoir through a series of aerating nozzles to the lower reservoir.

During 1901 an additional source of supply was obtained by purchasing certain water rights at Chenango Lake

located 3 mi. northeast of Reservoir No. 1, in the town of New Berlin. Chenango Lake, with a lake surface of about 130 acres, has a drainage area of 0.78 sq.mi. The water rights acquired allowed the company to lower the water in the lake 7 ft. below normal. Water from Chenango Lake is transmitted through a 761-ft. long rock tunnel, and a 14-, 16- and 18-in. di-

ameter pipeline 9,630 ft. to a branch of Ransford Creek down which it flows another 8,000 ft. to Reservoir No. 2.

The combined impounding capacity of the two reservoirs and Chenango Lake is approximately 314 mil.gal., of which approximately 310 mil.gal. is available for use.

A second 12-in. cast-iron transmission main was installed from Reservoir

No. 2 to the city in 1904. Both lines are approximately equivalent to existing Class A thickness.

In 1910 there was a shortage of water and therefore, in 1911, a small pumping station was installed to take water from Chenango River. Subsequently this station was dismantled and, in 1913, a standby supply was developed by installing an intake in Chenango River within the city. Water flowed by gravity through 409 ft. of 12-in. cast-iron and terra cotta pipe to a concrete suction well, 14 ft. in diameter by 19 ft. deep. In emergencies the water was pumped through pressure filters by a turbine type pump

of 2,800-gpm. capacity. This emergency supply has not been used for some time and the electric motor has been transferred to another plant.

The original supply of water was delivered to consumers without treatment until 1905. In that year a filter plant was installed in the town of Norwich about 400 ft. east of the Norwich city limits. It consisted of four horizontal, rapid-sand pressure filters. Two additional filters were added in 1907. Chemical application equipment was added in 1924 and 1929.

The distribution and transmission system consists of approximately 26.7 mi. of cast-iron pipe from 4 to 18 in. in diameter and  $\frac{3}{4}$ - to 2-in. wrought-iron and copper pipe. It has 270 valves and 230 fire hydrants.

### Basis of Study

The records of pipe, valve and hydrant installations and retirements are substantially complete from the beginning of the system.

### Mortality Survival Study

Mortality studies were made of cast-iron mains, valves and hydrants. Table 1 gives a summary of the pipe installed, retired and the amount remaining in service, as well as other pertinent data. Figure 1 shows the mortality survival curves covering the record of the pipe grouped as shown.

Tables 2 and 3 give summaries of valves and hydrants and Figs. 2 and 3 show the applicable mortality survival curves.

### Causes of Retirement

The causes of retirement of mains and valves respectively are shown in Tables 4 and 5.

TABLE 5  
CAUSES OF RETIREMENTS OF VALVES  
NORWICH, NEW YORK

Size, in.	Number Retired	Life, yr.	Cause of Retirement	Number Salvaged
4	2	12.5	Replaced with 10-in. main	—
	1	12.5	Renewed	—
	1	23.5	Blowoff line removed	1
	1	41.5	Retired	—
	5			1
12	1	57.5	Relocation of State Highway	1
	1			1
14	1	38.5	Leaking, scrapped	0
	1			0

It was stated that the majority of retirements of hydrants were due to relocation or to damage by automobiles, in which cases the hydrants were inspected, repaired where necessary, and set in other installations.

#### Acknowledgment

The collection and compilation of the data in the Norwich plant were under the supervision of E. L. Heyser, Chief Valuation Engineer of the New York Water Service Corporation.

## Sag Harbor, New York—Survival and Retirement Experience With Water Works Facilities

As of December 31, 1940

THE villages of Sag Harbor and North Hampton, N.Y., and surrounding area lying within the towns of Southampton and East Hampton, Suffolk County, located on the eastern end of Long Island, receive water service from the Sag Harbor plant of the New York Water Service Corporation, a private corporation.

These villages are small, largely residential in character and are located in the summer resort area of eastern Long Island.

For the year ending 1940 the company furnished water to 559 customers in a territory having a population of approximately 2,600. Sales of water averaged 0.083 mgd., which is equivalent to 32 gpd. per capita.

### Development of the Existing System

The Sag Harbor Water Company was incorporated on Dec. 19, 1888. Plant construction was started in March of 1889 and water service commenced in the latter part of the year. In 1893 the Fahys Watch Case Company acquired control of the water company and operated the plant until August 1928 when Francis W. Collins took over the management.

In June 1930 the Federal Water Service Corporation acquired control of the Sag Harbor Water Company. In November it was merged with and became the Sag Harbor plant of the New York Water Service Corporation, a subsidiary of Federal Water & Gas Corporation.

The original source of water supply was secured from four dug wells located in the southern part of the village of Sag Harbor. Because of the high iron content of the water from these wells, in 1897, the company secured permission to take water from Long Pond, located in the town of Southampton just south of Sag Harbor. The water flows from Long Pond northwesterly down Ligonee Brook about 1,700 ft. and thence through 590 ft. of 12-in. diameter terra cotta pipe to a brick basin constructed in one of the wells. Water was allowed to coagulate in this basin and then was pumped into the system by steam driven pumps.

In 1920 the company purchased land on three sides of Long Pond and erected a small concrete dam 4 ft. high and about 19 ft. long at the northwest corner. The top of the dam is only 10.7 ft. above sea level. In 1922 the flow from Long Pond was increased by deepening Ligonee Brook and a concrete intake and screen chamber were constructed at the lower end and connected to the 12-in. terra cotta pipeline.

In 1924 an electric pumping station was erected and the operation of the steam station was discontinued.

Two wells were installed to augment the supply, one in 1926 and the other in 1931. The first well was 6 in. in diameter and 55 ft. deep. The second well is a 10-in. well 129 ft. deep. The 6-in. well was not in use in 1940 but was in reserve and had a potential yield

8		1,025	104

of 0.4 mgd. The 10-in. well was in use and yielded, on an average, 0.576 mgd.

In 1937 the boilers and all steam equipment were removed from the original steam station and two steel pressure filters were installed. Water now is pumped from the wells to an aerator through which it flows by gravity to a coagulating basin and thence through a sedimentation basin. It is then pumped through the pressure filters to the distribution system.

The pumping equipment consists of two 300-gpm., duplex high-lift pumps, driven by 15-hp. motors installed in 1924 and a low-lift, 300-gpm. centrifugal well pump, installed in 1937.

Water storage facilities consist of an open steel standpipe, 20 ft. in diameter by 100 ft. high, capacity 235,000 gal., erected in 1889 in Sag Harbor, with overflow at an elevation of 136 ft.

As of Dec. 31, 1940, the company had in service approximately 8 mi. of pipe from 1 to 10 in. in diameter, with 66 valves and 70 fire hydrants. Metered customers numbered 257 and flat rate customers 302.

### Basis of Study

The records of the system with reference to pipe and valves are complete from the original date of installation.

### Mortality Survival Study

Mortality studies of mains and valves were made. Table 1 is a summary of mains installed, retired and remaining in service, as well as other pertinent data relating thereto. Figure 1 shows the mortality survival curves covering the above record.

Table 2 and Fig. 2 are similar sum-

mary and mortality survival curves covering valves installed and retired.

### Causes of Retirement

The causes of retirement of mains and valves are shown in footnotes in Tables 1 and 2, respectively.

### Acknowledgment

The collection and compilation of data for the study in the Sag Harbor plant were under the general supervision of E. L. Heyser, Chief Valuation Engineer of the New York Water Service Corporation.

## Rochester (Suburban), New York—Survival and Retirement Experience With Water Works Facilities

As of December 31, 1940

THE Rochester plant of the Rochester & Lake Ontario Water Service Corporation, a private utility, renders water service in the towns of Greece, Gates, Brighton, Pittsford, Irondequoit, Penfield and Periton, portions of the 10th, 18th, 21st, 23rd and 24th Wards of the city of Rochester and the villages of East Rochester, Penfield and Pittsford. The company also sells water wholesale to other villages and water districts for resale to customers located therein. These communities are located in Monroe County suburban to the city of Rochester, N.Y.

The territory served by the Rochester plant is predominantly residential in character, although a few industries are located in the service area. As of Dec. 31, 1940, there were 15,570 customers, including three villages and nineteen water districts. There were in service approximately 229 mi. of mains with 683 valves and 1,210 fire hydrants. Sales in a service area having a population of 110,300 amounted to an average of 6.4 mgd., which is equivalent to 58 gpd. per capita.

### Development of the Existing System

The Rochester & Lake Ontario Water Company was incorporated on Dec. 30, 1902. Plant construction was started in July 1903 and the first water service rendered in December 1904. Control of the Rochester & Lake On-

tario Water Company was acquired by the New York Water Service Corporation, in turn controlled by the Federal Water Service Company, in November 1927. In January 1928 the Rochester & Lake Ontario Water Company was consolidated with the Clyde Water Supply Company to form the Rochester & Lake Ontario Water Service Corporation. The plant serving the area around Rochester is known as the Rochester plant.

The supply of water comes from Lake Ontario and is obtained through an intake crib located about 4,300 ft. offshore, 21 ft. below normal lake level. The water flows from the intake crib through a 24-in. diameter cast-iron intake line into an intake well, located at the Charlotte pumping station.

The water is pumped by low-lift pumps from the intake well to two sedimentation basins, each having a capacity of 0.9 mil.gal. The settled water flows from these basins into two suction wells where it is picked up by high-lift pumps which pump through pressure filters to the distribution system. The water is treated before entering the intake well and at points in passing through the station with sulfate of alumina, lime, copper sulfate, ammonia, activated carbon and chlorine.

The primary station of the company is the Charlotte pumping station. It is located on the shore of Lake Ontario

about 1,500 ft. west of the corporate limits of the city of Rochester in the town of Greece. It consists of one large building, erected in 1904, housing boilers, pumping and purification equipment, office and laboratory and, adjacent, two sedimentation basins and smaller auxiliary structures.

The main part of the station houses two water tube boilers equipped with stokers and auxiliaries; two steam-driven high-lift pumps, installed in 1905; one steam-driven low-lift pump, installed in 1907; two electric motor-driven low-lift pumps, one installed in 1923, and one in 1933; and three elec-

tric motor-driven high-lift pumps, installed in 1912, 1916 and 1929. The elevation of the high-lift pumps is 260 ft. above sea level.

The filter room houses 22 high-pressure sand filters and auxiliary purification equipment. Eight filters were installed in 1905, two in 1917, four in 1925, six in 1930 and the final two in 1931. There are also two deep well pumps, installed in 1928 and 1930, located in the intake well.

Purified water is discharged at from 225- to 240-psi. pressure from the filter

effluent into two 20-in. cast-iron transmission mains. The original main, installed in 1904-1905, consists of 20-in. diameter pipe of Classes E to B. It carries water in a southeasterly direction to standpipes located on Cobb's Hill. The elevation of the overflow of these standpipes is 653 ft. From them water flows to the distribution system and through a third transmission main, 12 in. in diameter, installed in 1905, southeastwardly to the villages of East Rochester and Fairport.

The second transmission main, also 20 in. in diameter, installed in 1928, also carries water in the same general

direction to the standpipes on Cobb's Hill.

Distribution mains take off from the three transmission mains at various points along their lengths.

Pressures and adequate flows are maintained in the system by six booster stations, each consisting of a motor-driven pump and auxiliaries. These stations, and dates of construction, are as follows: Ridge Road (1917), Culver Road (1926), Pittsford (1928), Linden Road (1929), Echo Street (1931) and Cobb's Hill (1937).

The water storage facilities of the

plant include a steel standpipe of 2,651-mil.gal. capacity, elevation of overflow 653 ft., built on Cobb's Hill in 1904; one steel standpipe at the same elevation with 5,891-mil.gal. capacity, erected in 1930 at Cobb's Hill; and an elevated steel tank of 0.2-mil.gal. capacity, erected in 1930 and located at Buffalo Road and the Barge Canal in the southwestern part of the city of Rochester.

### Basis of Study

The data on pipe, valves and hydrants relating to their installation and retirement are stated to be complete from the beginning of the plant.

### Mortality Survival Study

Mortality studies were made of cast-iron mains, valves and hydrants. Table 1 gives a summary of the cast-iron pipe installed, retired and the amount remaining in service, as well as other pertinent data relating thereto. Figures 1 and 2 show the mortality survival curves covering the record of the pipe grouped as shown.

The summaries of valves and hydrants are given in Tables 2 and 3 and the applicable mortality survival curves in Figs. 3 and 4.

### Causes of Retirement

The causes of retirement of cast-iron mains and valves are shown in Tables

4 and 5. No detailed causes of retirements of hydrants were available. The plant officials state as follows: "Majority of retirements were due to relocation or to damage by automobiles. In these cases hydrants were inspected, repaired and installed in a new location or reset at another location at some later date."

### Acknowledgment

The collection and compilation of data pertaining to the Rochester plant were under the general supervision of E. L. Heyser, Chief Valuation Engineer of the New York Water Service Corporation.

# Syracuse (Suburban), New York—Survival and Retirement Experience With Water Works Facilities

As of December 31, 1940

THE Syracuse plant of the New York Water Service Corporation provides water service to an area suburban to the city of Syracuse, including parts of the towns of Marcellus, Camillus, Geddes, Salina, DeWitt, Manlius, Clay and Cicero and excluding the villages of Marcellus, East Syracuse, Solvay, Liverpool, Minoa and separate water districts within the above mentioned towns. It also furnishes standby service within the corporate limits of the city of Syracuse with provision that the water should be used solely in cases of emergency. The company also sells water at wholesale rates for redistribution to water districts, including Camillus, Split Rock, Gulf, West Genessee Park, Fairmont, Syracuse Gardens, City View and Cicero and the incorporated villages of Liverpool, Solvay and Minoa. All service is rendered through meters.

The service area is chiefly residential and typical suburban territory surrounding Syracuse in Onondaga County in the central part of New York State. Some large industries are located in the area served.

At the date of the study the company had in service approximately 87.5 mi. of pipelines, including 416 valves and 275 fire hydrants. During 1940 the company furnished 6.3 mgd. to 2,816 customers, including ten water districts and nine large industries. Of the 6.3

mgd. approximately 5.0 mgd. was furnished to the large industries, which include the New York Central Railroad, Marcellus & Otisco Railroad Company and Solvay Process Company. The remaining 1.33 mgd. was used in the area and by the ten water districts which have a population of 29,000. This is equivalent to about 46 gpd. per capita.

## Development of the Existing System

The original service in the territory was furnished by the Onondaga County Suburban Water Company, incorporated in April 1907. On Nov. 1, 1907, the name was changed to Syracuse Suburban Water Company. Plant construction started shortly after the first of 1908 and the first sale of water was in June 1909.

On Nov. 30, 1926, the property was acquired by the New York Water Service Corporation, a member of the Federal Water Service Company, and the name of the company was changed to the Onondaga Water Service Corporation. On May 7, 1929, the property was merged with and became the Syracuse plant of the New York Water Service Corporation.

The company's source of water supply is Lake Otisco, located in the town of Marcellus, Onondaga County, some 18 mi. southwest of Syracuse. The lake is owned by the state of New York

but the flood rights around it are owned by the company. The legislature, in 1907, granted the Onondaga County Suburban Water Company the right to construct and maintain a dam, intake pipe and accessories necessary to impound an additional supply of water in Otisco Lake for the purpose of supply-

ing pure and wholesome water to municipalities under certain restrictions and conditions.

Besides protecting the state against all claims and demands of riparian owners on Lake Otisco, which required the securing of the riparian rights along the shores and the outlet of the lake, the

company was required to furnish water to the Fair Grounds of the State Fair Commission.

This act gave the company the right to impound for and withdraw 5 mgd. from the lake. In 1922 the company

received permission to take 11 mgd. In 1909 the company built a masonry dam and earthen embankment 127 ft. long and 21.5 ft. high, with the spillway 786.6 ft. above sea level.

Water is taken from Otisco Lake

through a timber crib located approximately 6,200 ft. south of the dam with which it is connected by 6,174 ft. of 24-in. diameter, Class A cast-iron pipe. The intake is located about 18 ft. below the surface of the lake. Up to approximately 8.3 mgd. can flow through the transmission mains by gravity and when the daily draft exceeds this amount pumping is required.

The primary pumping station is located in the town of Marcellus just below the dam. It consists of a one-story building with substructure, 22 ft.

deep, housing one 6,000 gpm., 150-hp. motor-driven centrifugal pump and a similar 7,000-gpm. pump driven by a 150-hp. gasoline engine.

Auxiliary booster pumping facilities are located in a building known as the Wolf Street Booster Station situated some 1,000 ft. northeast of the northeast corporate limits of Syracuse. The pump room contains a centrifugal pump of 2,800-gpm. capacity driven by a 100-hp. electric motor which is used to increase the delivery and pressure to the territory lying north and east of the booster station.

Water is delivered from Lake Otisco through the original transmission main, constructed in 1908-1909, of 12-, 16-, 20- and 24-in. cast-iron pipe to the various districts, towns and villages served. In 1928-1929 the original line was paralleled with 87,752 ft. of 24-in. Class B cast-iron pipe, and interconnected at four points.

Water is treated with liquid chlorine and ammonium sulfate fed at the gate and chemical house at Lake Otisco.

Water storage facilities in the distribution system include an earth embankment reservoir located in the town

of Camillus, known as Fairmont Reservoir. It is 265 ft. in diameter and has a capacity of 5 mil.gal. It was constructed in 1909 with a water surface elevation of 609. There is also an elevated steel tank, constructed in 1930. It is 40 ft. in diameter and 20 ft. high, with a capacity of 0.25 mil.gal. and overflow of elevation of 555 ft.

### Basis of Study

The records of the system pertaining to the transmission and distribution mains, valves and hydrants are stated to be complete from the date of installation in 1910.

### Mortality Survival Study

Mortality studies were made of cast-iron mains, valves and hydrants. Table 1 is a summary of the pipe installed, retired and the amount remaining in service, together with other pertinent data. Figure 1 shows the mortality survival curves covering the record of the amount and sizes of pipe grouped as shown.

Tables 2 and 3 are similar summaries of valves and hydrants, with Figs. 2 and 3 representing the applicable mortality survival curves.

### Causes of Retirement

The causes of retirement of mains, valves and hydrants are given in Tables 4, 5 and 6.

### Acknowledgment

The collection and compilation of data pertaining to the Syracuse Plant were under the general supervision of E. L. Heyser, Chief Valuation Engineer of the New York Water Service Corporation.

These "Tentative Standard Specifications for Sulfate of Alumina" are based upon the best known experience and are intended for use under normal conditions. They are not designed for unqualified use under all conditions and the advisability of use of the material herein specified in any plant must be subjected to review by the engineer responsible for operation in the particular locality concerned.

Approved as Tentative by the Board of Directors of the A.W.W.A. on  
November 19, 1945

COPYRIGHTED AS PART OF THE DECEMBER 1945 JOURNAL OF THE  
AMERICAN WATER WORKS ASSOCIATION

*First Printing, December 1945*

**AMERICAN WATER WORKS ASSOCIATION**

*Incorporated*

**500 Fifth Avenue, New York 18, N.Y.**

Year  
1940

### **Preparation**

*With the removal of War Production Board restrictions, the Emergency Alternate Specifications for Sulfate of Alumina became obsolete. The officers of the Water Purification Committee have constituted themselves a committee to revise the specifications and have approved the following document to cover sulfate of alumina for water treatment purposes. The Committee on Water Works Practice has also approved these specifications.*

*The original A.W.W.A. Specifications for Sulfate of Alumina appeared in the Manual of Water Works Practice under the general heading "Specifications for Chemicals Used in Water Purification." The Emergency Alternate Specifications for Sulfate of Alumina, adopted by the A.W.W.A. Board of Directors on June 25, 1942, were published in the 1942 JOURNAL, page 1073.*

## *Tentative*

# Standard Specifications for Sulfate of Alumina

### Section 1-1—Scope

These specifications for sulfate of alumina are promulgated for the use of purchasing agencies handling the procurement of material used in water treatment for public or general industrial supplies.

### Section 1-2—Types

Two types of sulfate of alumina are described, as follows:

**2.1—Purified**—Sulfate of alumina from which the major portion of the insoluble material has been removed.

**2.2—Unpurified**—Sulfate of alumina from which only a minor part of the insoluble material has been removed.

### Section 1-3—Basis for Purchase

The purchasing agency shall:

**3.1**—State the type of sulfate of alumina required.

**3.2**—Specify whether lump or ground sulfate of alumina is desired.

**3.3**—State the method of packaging or shipment desired.

### Section 1-4—Size of Lumps or Grains

**4.1**—Lump sulfate of alumina shall range in size from not less than  $\frac{3}{4}$  in. to not more than 3 in.

**4.2**—Ground sulfate of alumina for use in dry feeding machines shall be of such size that not less than 95 per cent shall pass a woven sieve having 10 meshes per linear inch and 100 per cent

shall pass a sieve having 4 meshes per linear inch.

### Section 1-5—Packing and Shipping

Sulfate of alumina may be ordered shipped:

**5.1**—In bulk.

**5.2**—In 100-lb. multi-wall paper bags.

**5.3**—In 200-lb. textile or burlap bags.

**5.4**—In 400-lb. barrels.

The net weight of bags or barrels shall not deviate from the recorded weight, plus or minus, by more than 2.5 per cent. Exception taken to the weight of material received shall be based on certified unit weight of not less than 10 per cent of the packages shipped and selected at random from the entire shipment.

### Section 1-6—Sampling and Testing

**6.1**—The composition of the sulfate of alumina shall be determined by analyzing samples taken promptly upon the arrival of material at the point of consumption.

**6.2**—When sulfate of alumina is shipped in bulk, the sample shall be so taken that it will represent an average of all parts of the shipment from top to bottom, and shall not contain a disproportionate share of the top and bottom layers. It shall weigh at least 10 lb. and shall be crushed if necessary

and mixed thoroughly and "quartered" to provide two 1-lb. samples, one of which shall be used for the immediate testing. The other 1-lb. sample shall be kept carefully sealed for use in a possible retest as provided hereinafter.

6.3—When shipped in packages, at least 3 per cent of the number of packages shall be sampled. They shall be taken from various parts of the shipment, dumped, mixed and sampled as in the above paragraph.

6.4—Notice of dissatisfaction with a shipment based on these specifications must be in the hands of the consignor within ten days after the receipt of the shipment at point of destination. If the consignor desires a retest, he shall notify the consignee within five days of receipt of the notice of complaint. The duplicate sample shall then be forwarded for a retest to some laboratory agreed upon by both parties. This

retest shall be made at the expense of the consignor and the results accepted as final.

### Section 1-7—Chemical Requirements

7.1—The material shall be basic.\* It shall contain not less than 17 per cent available water soluble alumina ( $\text{Al}_2\text{O}_3$ ). It shall not contain more than 0.75 per cent iron ( $\text{Fe}_2\text{O}_3$ ).

7.2—Insoluble matter shall not exceed:

7.2.1—*In purified sulfate of alumina*—0.5 per cent of material insoluble in distilled water.

7.2.2—*In unpurified sulfate of alumina*—10.0 per cent of material insoluble in distilled water.

\* *Editor's Note:* The term "basic" means that the content of sulfuric acid as found shall be less than that theoretically required to combine with the alumina and iron present.

## A.W.W.A.—1945

**B**ECAUSE of the Office of Defense Transportation ruling that no nation-wide meetings be held during 1945, the annual convention of the A.W.W.A., scheduled to be held in St. Louis, Mo., May 7-11, 1945, was canceled. There was substituted a meeting of the Executive Committee in New York City on June 29-30, 1945, to transact the necessary official business connected with the transfer of the presidency of the Association from Samuel F. Newkirk Jr. to Leonard N. Thompson.

Based upon prior expressions of opinion by the members of the Board of Directors, the Executive Committee took formal action in four important categories:

1. Authorized the establishment of a Committee on Public Relations of the Water Works Industry.

2. Voted to continue participation in the work of the Committee on Water and Sewage Works Development.

3. Voted affiliation of the American Water Works Association as an *association* member of the Chamber of Commerce of the United States.

4. Voted support (*in part*) of the Spence Bill (H.R. 592) and its counterpart, the Barkley Bill (S.1037), both intended to promote federal interest in the control of stream pollution.

The special Committee on Public Relations of the Water Works Industry has as its Chairman E. L. Filby of Kansas City, Mo. Each section of the Association has at least one member on the committee—the larger sections, two members. This committee

is a *survey* group with the definite task of considering and evaluating the various methods which can be used to promote the public's understanding of water supply as a public service as well as to increase the appreciation of the value of the services rendered by the men and women in the water works industry. Its creation evidences the opinion of the Association's officers and directors that, while water works executives and personnel have well established records for successful planning, construction and operation of water supply works, these executives, and the industry as a whole, have been too prone to let their good works speak for themselves. Suggestions have been made that the Association carry on a national program of institutional advertising; that it develop a series of informative motion pictures; that it prepare advertising copy for water works plants to run in their local newspapers; that it prepare brochures and leaflets for water works superintendents to distribute to their customers; that it set up a special field staff to aid local executives in their contacts with municipal authorities, etc. Filby and his committee have been asked to review these and other suggestions which have been made, all intended to establish a positive program for a better public understanding of the water works industry. They are to present a plan of recommended action to the A.W.W.A. Board at its January 1946 meeting. At that time the Board will authorize such program as it desires, set up such staff operations as appear to

be indicated and establish a permanent Public Relations Committee, if such a committee from the Association's membership seems desirable.

The Executive Committee reviewed the series of comments which had been made by the members of the Board of Directors in response to the question "Should the A.W.W.A. become an Association Member of the U.S. Chamber of Commerce?" It was noted that the Directors' opinion was strongly in favor of such affiliation. The Executive Committee therefore authorized A.W.W.A. membership in the U.S. Chamber of Commerce. The consensus of opinion of Board members and officers may be expressed as follows: Water works executives and local Chambers of Commerce work together to advance their home communities. Public water supply service of high order is essential to community advancement. The U.S. Chamber of Commerce gives national leadership to local Chambers of Commerce and the A.W.W.A. gives continental leadership to the water works industry. The co-operation which now exists at the local level should be promoted by co-operation at the national level. The A.W.W.A. will participate in the work of the U.S. Chamber of Commerce as it relates to community advancement and to the field of interest of the A.W.W.A. The A.W.W.A. will retain its complete freedom of attitude and policy with relation to economic and social questions upon which the U.S. Chamber of Commerce takes a recorded position, accepting such of these viewpoints as it sees fit and considering itself in nowise bound by those which it does not accept. This policy of association affiliation by the A.W.W.A. is accepted by the U.S. Chamber of Commerce.

Abel Wolman, Chairman of the A.W.W.A. Committee on National Water Policy, recommended limited endorsement of the Barkley (Senate) and Spence (House) Stream Pollution Control Bills. The Executive Committee accepted Wolman's recommendations and approved the Barkley-Spence Bills *except* in so far as they establish a permanent policy of federal grants-in-aid for the construction of sewage treatment works.

The A.W.W.A. therefore endorses the assignment of certain responsibilities and duties with relation to stream pollution control to the Sanitary Engineering Division of the U.S. Public Health Service; the preparation by it, and related federal agencies, of comprehensive plans for stream pollution control; and encouragement by the U.S.P.H.S. of co-operative activities by the various states looking toward pollution control. The A.W.W.A. endorses the portions of the bills which authorize the U.S.P.H.S. to make investigations of the water pollution problems in any state upon request of the state's health department and further authorizes the publication of reports and recommendations concerning these investigations by the U.S. P.H.S.

The A.W.W.A. also endorses the establishment of a Water Pollution Control Advisory Board within the U.S.P.H.S. to be appointed annually by the Surgeon General. (Under the terms of the bill this board will consist of the following five persons:—The Surgeon General, U.S.P.H.S., or a sanitary engineer officer designated by him, who shall serve as Chairman of the Board; the Chief of Engineers, U.S. Army, or a member of the Corps of Engineers designated by him; the

Director, U.S. Fish and Wildlife Service, or a representative designated by him; and two persons not officers or employees of the federal government. One such person shall be active in the field of sewage and industrial waste disposal and the other person shall have shown an active interest in the field of wildlife conservation.)

The A.W.W.A. *does not endorse* Secs. 5, 6 and 7 of the bill, which establish a permanent policy of federal grants-in-aid for states, municipalities, other public bodies and *persons* for the construction of sewage and waste treatment works.

The A.W.W.A. Executive Committee found itself provided with the formal record of prior approval by the A.W.W.A. Board of Directors of principles which guided it in considering the recommendations made to it by Dr. Wolman. The A.W.W.A. Board and its Executive Committee can consistently endorse the portions of the Barkley and the Spence bills in so far as they authorize the U.S.P. H.S. and its Water Pollution Control Advisory Board to take the lead nationally in the promotion of stream pollution abatement, but until such time as federal grants-in-aid are initiated as part of a national program of unemployment relief, the A.W.W.A. cannot support the portions of the Barkley and Spence bills which authorize grants-in-aid for sewage treatment works.

The Executive Committee received the report of the Secretary advising that:

1. The Directors had voted in favor of authorization for section secretaries to form an organization and to hold a

meeting during each annual convention.

2. The Directors had adopted the amended form of Article VII of the By-Laws which covers section and division organization and allotment of funds.

3. The Directors had approved the memorandum entitled "Approved Uses of A.W.W.A. Funds Allocated to Sections."

The Executive Committee discussed the possible continuation of the work of the Committee on Water and Sewage Works Development. Chairman Wolman, for the Committee, reported the progress made by water and sewage works in planning postwar construction. The Committee noted that the Water and Sewage Works Manufacturers Association is willing to defray the cost of the inter-association activity. It was therefore agreed, *for the A.W.W.A.*, to continue the work of the Committee on Water and Sewage Works Development as long as the members of the committee (representing the four associations) feel that the work should be continued.

The Committee accepted the dates which had been agreed upon (May 6-10) for the 1946 Convention, to be held in St. Louis.

Samuel F. Newkirk referred to discussions by the members of the Committee on Honorary Membership which concerned a possible limit on the total number of Honorary Members of the A.W.W.A., or a limit on the number of persons who might be named as Honorary Members in any year. Mr. Newkirk agreed to review the practices of similar organizations and report to the Board at a later date.

## Presentation of Awards

**Honorary Membership**—At the annual meeting of the Board of Directors, held in New York City, Jan. 15–16, 1945, the following men were elected to Honorary Membership:

*Robert W. Angus*, Professor Emeritus of Mechanical Engineering, University of Toronto; a member of the Association since 1917; recipient of the Fuller Award in 1942; distinguished as a teacher of engineering and as a leader among engineers within and beyond the boundaries of the Dominion of Canada.

The certificate presentation was made by Samuel F. Newkirk at the Canadian Section Meeting, Mar. 20, 1945.

*George W. Booth*, Chief Engineer, National Board of Fire Underwriters, New York, N.Y.; a member of the Association since 1924; characterized in his work by a great purpose—the protection of the public against fire loss, incidental to which water supply works in North America have been aided substantially.

*Willard Chevalier*, Vice-President, McGraw-Hill Publishing Company, publisher of *Business Week*, New York, N.Y.; a member of the Association since 1934; a Director of the Association in 1937–40; recipient of the Goodell Prize in 1934; America's leading interpreter of the engineering viewpoint in the field of commerce and industry.

Messrs. Booth and Chevalier received their certificates at the June meeting of the Executive Committee.

**The John M. Diven Medal**—The Executive Committee accepted the recommendation of the Diven Medal Award Committee that no award be made for the year 1944. The committee reasoned that, although there have been numerous examples of meritorious service being rendered, such services have been of a regional rather than a continental nature. The wartime demands for full-capacity service of members within their own fields of direct responsibility have prevented their carrying on such services as have previously been the basis of the Diven Medal Award.

**The John M. Goodell Award**—This award for the best paper published in the JOURNAL of the Association was presented at the Missouri Valley Section Meeting on October 29 to:

*H. V. Pedersen* for his paper entitled "Calcining Sludge From a Softening Plant," which appeared in the November 1944 issue of the JOURNAL. In this paper, the author, a water works superintendent in a medium-sized city, describes his experiments designed to recover and make use of the spent lime derived from water softening operations. The paper has merit not alone because it records a diligent attack upon an important subject, but also because it demonstrates the ability of a mentally alert water works executive to give effective attention to problems beyond his daily routine.

**George M. Fuller Memorial Awards** will be presented to the following members at the 1946 annual conference in St. Louis:

Section	1944	1945
California	George Charles Sopp	*
Canadian	†	Charles Jules Des Baillels
Cuban	*	*
Florida	Keith Roderick Chinn	Henry H. Hyman
Four States	Gustav Jaeger Requardt	‡
Illinois	†	Adolph Emil Anderson
Indiana	†	*
Kentucky-Tennessee	*	*
Michigan	†	Raymond Johns Faust
Minnesota	†	Otto Ellsworth Brownell
Missouri Valley	Earle Lytton Waterman	Otto S. Reynolds
Montana	†	*
New England	*	*
New Jersey	Percy Suydam Wilson	John Leonard Radcliffe
New York	†	*
North Carolina	*	James Wilford Kellogg
Ohio	†	*
Pacific Northwest	†	*
Rocky Mountain	Chester Arnold Truman	Henry Griffith Watson
Southeastern	†	*
Southwest	Thomas Lampkin Amiss	Robert Wolcott Harding
Virginia	Richard Messer	Charles Lucian Crockett
Western Pennsylvania	*	Charles Louis Fox
West Virginia	Harry Kenneth Gidley	Max K. Jones
Wisconsin	*	*

\* No award given.

† Award presented at Milwaukee Conference.

‡ 1945 Meeting not yet held.

Additions to the above list may be made by sections which hold their 1946 meetings prior to the St. Louis Conference.

**The Nicholas S. Hill Cup**—This cup has been awarded annually since 1916 to the section making the largest gain in membership since the last convention of the A.W.W.A. Since there was no convention during 1945, the Executive Committee directed that the award for the year 1944-45 be based on the membership totals as of June 30, 1945. This year's winner was the Missouri Valley Section, whose point score was 32.2. Second and third respectively were the Virginia Section, with a point score of 25.5, and the Canadian Section, with a score of 23.4.

**The Henshaw Cup**—Since section meetings were subject to the same wartime travel limitations as the annual convention, no Henshaw Cup was awarded during 1945. Inasmuch as the sections which held Fall meetings during 1944 have made up their records looking toward the award in 1945, the scores they have made will carry over into 1946.

**The Old Oaken Bucket**—The award for top membership for the seventh successive time was won by the California Section. As of June 30, 1945, this section had a total membership of 655.

## Papers Scheduled at Section Meetings

THERE follows a chronological listing of papers scheduled for presentation at 1945 Section Meetings. The dates of the Section Meetings from 1941-45 and locations for 1945 are given on page 1404. A record of membership totals at the time of, and attendance at, the meetings in 1941-45 is presented on page 1405. Section officers who were elected at meetings held during 1945 are listed on page 64 of this JOURNAL.

### New York Section—January 17, 1945

Address.....	Arthur H. Motley
The Present Outlook.....	Arthur E. Gorman
Classification and Control of Maintenance.....	F. Rigdon Berry
Effects of the 1944 Hurricane on Water Works:	
Experiences in Nassau County.....	J. L. Barron
Comments From the Underwriters' Viewpoint.....	A. C. Hutson
Lessons To Be Learned.....	Reeves Newsom

### Canadian Section—March 19-21, 1945

Address.....	R. P. Vivian
Address.....	Mayor R. H. Saunders
Address.....	Samuel F. Newkirk
Symposium—Distribution Systems for Small Communities:	
Design of the Distribution System.....	J. G. Powell
Operation and Maintenance of the Distribution System.....	E. E. W. Oke
Guided Discussion—Operational Problems in Distribution Systems.....	Led by J. W. Peart
Symposium—Underground Water Supplies:	
Location and Development of Underground Water Supplies:	
Gravel Wall Wells.....	T. L. McManamna
Rock Wells.....	E. F. Roberts
Maintenance and Operation of Underground Water Works Systems.....	V. A. McKillop
Guided Discussion—Problems of Underground Water Supplies.....	Led by H. S. Nicklin
Symposium—Water Purification:	
Filter Sand Washing Methods.....	J. C. Street and A. H. R. Thomas
Chlorination and Taste Control.....	N. J. Howard and H. P. Stockwell
Guided Discussion—Operating Problems in Water Treatment.....	Led by W. B. Redfern
Guided Discussion—Operation and Maintenance of Water Works Pumping Equipment.....	Led by R. W. Angus
Guided Discussion—The Sales Engineers' Viewpoints on Tendering for Water Works Equipment.....	Led by W. Storrie
Symposium—Water Works Administration:	
For Public Utility Administration.....	R. W. Strike
Discussion.....	Led by W. G. Case
For Council Administration.....	F. G. Gardiner
Discussion.....	Led by Alex. Bissett
Symposium—Postwar Planning:	
Activities of the Water and Sewage Works Development Committee.....	Harry E. Jordan
What Can We Learn From Britain's Postwar Employment Policy?.....	James I. Simpson
Planning in Ontario.....	A. E. K. Bunnell
Guided Discussion—Service Line Materials and Installation.....	Led by R. Harrison

**Montana Section—April 13-14, 1945**

Address of Welcome.....	Mayor E. R. Roehl
Response.....	Fred Palmer
Our Broadened Horizons.....	Leonard N. Thompson
An Analysis of Montana's Stream Pollution Situation.....	H. B. Foote
Current WPB Activities and Material and Manpower Situations.....	G. E. Arnold
Water, Friend or Foe.....	<i>A Motion Picture</i>
Montana's Revenue Bond Act.....	Kenneth Chrysler
The Municipal Family.....	Arthur Baker
Soil Corrosion of Buried Metals.....	C. R. Davis
Substituting Horsepower for Manpower.....	D. I. Grush

**New York Section—Regional Meetings—May 22-25, 1945**

*In addition to the papers listed under the respective cities the following papers were presented at each of the Section's regional meetings:*

New York State Mutual Aid Program.....	Earl Devendorf
Manpower Savings in Water Works Operation.....	Samuel F. Newkirk
Water Works Materials From the War Production Viewpoint.....	Bayard F. Snow
Wartime Maintenance Problems.....	Hugh S. Dewey and Harry M. Huy

**Rochester—May 22, 1945**

Reconditioning 70-Year-Old Abandoned Water Main.....	Lewis B. Smith
Round Table Discussion—General Subjects.....	<i>Led by William H. Clark</i>

**Syracuse—May 23, 1945**

Meeting Wartime Demands in Suburban Syracuse.....	A. A. Korves
Round Table Discussion—General Subjects.....	<i>Led by Elon P. Stewart</i>

**Albany—May 24, 1945**

System Maintenance.....	Ernest L. H. Meyer
Round Table Discussion—General Subjects.....	<i>Led by William Luby</i>

**White Plains—May 25, 1945**

Artificial Recharge of Ground Water.....	R. M. Leggette
New York City's Water Supply to Outside Communities.....	Tobias Hochlerner
Round Table Discussion—General Subjects.....	<i>Led by James C. Harding</i>

**Kentucky-Tennessee Section—June 4-5, 1945 \***

Panel Discussion—Office and Distribution.....	<i>Led by E. E. Jacobson</i>
Panel Discussion—Pumping.....	<i>Led by Clark Cramer</i>
Panel Discussion—Purification.....	<i>Led by W. H. Lovejoy</i>

\* Kentucky Section only.

**Indiana Section—Regional Meetings—June 12-22, 1945**

*In addition to the papers listed under the respective cities the following papers were presented at each of the Section's regional meetings:*

Arithmetic of Water Supply	W. E. Howland
Bills Passed by Last Legislature Which Affect Public Water Supplies	Joseph L. Quinn
Report of Zone Developers	Respective districts reporting
Chlorine Handling	E. L. Gaudin, M. S. Clark and J. O. Logan
New Trends in Coagulation and Sedimentation	S. L. Tolman

**North Vernon—June 12, 1945**

Water Works Accounting in the Small Water Works	Everitt Robins
Cleaning and Cement Lining Water Pipe (Illustrated by a motion picture)	F. A. Schaefer

**Evansville—June 13, 1945**

Address of Welcome	Mayor Reichert
Address of Welcome	E. C. Henning
Meter Maintenance	Lawrence Spier
Water Works Accounting	G. J. Laine
Policies Concerning Main Extensions	Mike Schmitt
Substitute Materials	M. H. Schwartz

**Jasonville—June 14, 1945 \*****Crawfordsville—June 15, 1945**

Emergency First Aid	Ralph Young
Water Works Accounting	O. J. Stewart
Essentials of a Good Small Water Works	Thomas Burrin
Water Meter Maintenance	E. J. Good

**Monticello—June 19, 1945**

Address of Welcome	Roy Conrad
Water Purification by Ozonation	E. H. Ahlring
Meter Maintenance	C. A. Robbins
Avoidable Accidents	Jack Gordon
Water Works Accounting	Norman Seward
Essentials of a Good Small Water Works	Ralph Lomax
Policies Concerning Main Extensions	Floyd L. Kerns
Management in Wartime	F. I. Bridegroom

**LaPorte—June 20, 1945**

Address of Welcome	Mayor John Martin
First Aid	J. M. Falls
Meter Maintenance	A. R. Klein
Water Works Accounting	H. J. Draves
Construction Work (Illustrated by a motion picture)	Albert G. Vinick

\* General program only.

**Columbia City—June 21, 1945**

Address of Welcome.....	Mayor James A. Brown
First Aid.....	W. H. Seifert
Maintenance of Meters.....	Ross Burns

**Anderson—June 22, 1945**

Address of Welcome.....	Mayor C. D. Rotruck
Chlorinator Maintenance.....	Paul Laux
Distribution Appliances.....	O. I. Williamson

**New Jersey Section—Regional Meetings—July 25 and November 8-10, 1945****Monmouth County—July 25, 1945**

Legislative Committee's Report on Licensing of Water Superintendents..	Richard E. Bonyun
--	-------------------

**Atlantic City—November 8-10, 1945**

Study of Corrosion Control With Sodium Hexametaphosphate.....	P. A. Pallo
Discussion.....	Owen Rice
Graphitic Corrosion of Cast Iron As Experienced in Newark.....	L. M. Leedom
Legislative Committee's Report on Licensing of Water Superintendents..	Richard E. Bonyun
Relation of Geology to Water Supply Wells in New Jersey.....	Meredith E. Johnson
Symposium—Taste and Odor Removal Methods:	
Break-Point Chlorination.....	Jos. Reid
Activated Carbon.....	John L. Radcliffe
Chlorine Dioxide Treatment.....	L. Newell
Water Situation in New Jersey As Affected by the Proposed New Jersey Ship Canal.....	H. T. Critchlow
Cross-Connection Policy of Water Works Service Company.....	John H. Murdoch Jr.
Question Box.....	Directed by Martin Flentje
Round Table Discussions.....	Led by E. Vernon Smith
Hydrant Painting	
Valve Inspection	
Labor Relations	
Street Repairs	
Storage Tank Maintenance	

**Minnesota Section—Regional Meetings—September 11-18, 1945****Mankato, Minnesota—September 11, 1945**

Address of Welcome.....	Mayor C. K. Mayer
Response.....	Leonard N. Thompson
"Red Water," Its Cause and Cure.....	W. J. Bell

**Fargo, North Dakota—September 14, 1945**

Address of Welcome.....	Mayor F. F. Olsen
Response.....	A. M. Kircher
Water Softening at Fergus Falls.....	Howard J. Sowden
Future Improvements for Fargo.....	H. H. Behlmer
Predaceous Diving Beetles in Winnipeg's Water Supply.....	W. D. Hurst

**Duluth, Minnesota—September 18, 1945**

Address of Welcome	Mayor Johnson
Response	A. M. Kircher
Numerical Rating of Water Supplies	O. E. Brownell
Rural Water Supplies	Elmer C. Slagle
"Midwest" and the "Great Lakes Seaway"	T. W. Wahl

**Western Pennsylvania Section—September 14, 1945**

Symposium—Water Works Operating and Management Problems:	
Baffling Sedimentation Basins	R. W. Hayden
Discussion	Wm. J. Murdoch
Problems in Bacteriology	Marie A. Murphy
Discussion	C. K. Calvert
Foremen Training an Important Step Towards Better Management—Employee Relations (Illustrated by a motion picture)	W. B. Simpson
Fundamental Laboratory Technic for Determining Ferric Sulfate Dosage	J. B. Nickel
An Unusual Problem of Corrosion	H. M. Olson
Symposium—Raw Water Quality As Affected by Pollution:	
The Policies of the Pennsylvania Sanitary Water Board Regarding Stream Pollution	E. A. Holbrook
Pollution Control Program of the Pennsylvania Sanitary Water Board	J. R. Hoffert
Scope and Magnitude of Pollution in Western Pennsylvania	C. H. Young and L. S. Morgan
Raw Water Quality:	
Allegheny River at Aspinwall	C. F. Drake
Monongahela River at Pittsburgh	F. W. Bouson
Shenango River at New Castle, Pa.	B. French Johnson
Ohio River at Wheeling, W.Va.	A. R. Todd

**Michigan Section—September 19-20, 1945**

Round Table Discussion—Super-chlorination	
T. L. VanderVelde, Henry Gork, Lee Sensabaugh, Louis Harrison, J. E. Cooper, H. Keinath and C. H. Burdick	
News From the Field	Raymond J. Faust
Geology in Relation to Ground Water Supplies	Norman Billings and John Ferris
Synthetic Resins	W. C. Bauman
Back-Siphonage and Cross-Connections	Andrew Dempster
Some Problems Connected With Electrical Pumping	Louis E. Ayres
pH-Alkalinity Nomographs	John Dye
Water May Be Dangerous	F. S. Leeder
Application of Chlorine Dioxide to Municipal Water Supplies	Harry Ward
Round Table Discussion—Inservice Training School:	
Iron Bacteria, Chemistry of Iron in Water and Iron Removal	Harry McEntee
Fluorides and Dental Decay	W. L. Harris

**Rocky Mountain Section—September 21, 1945**

Address of Welcome	Gov. John H. Vivian
Response and Chairman's Address	K. E. Darling
Hard Water Tax	B. V. Howe
Discussion	Dana E. Kepner

Up to Date on Manpower and Materials and Postwar Water Works Planning.....	G. E. Arnold
Powers of Utility Commissions.....	Ray L. Sherard and C. A. Lathrop
Threshold Limits on Corrosive Waters.....	John T. Franks
Laws on Formation of Sanitary Districts.....	Emory L. O'Connell
Discussion.....	Carroll Coberly
Round Table Discussion—How Water Works Improvements Affect Fire Insurance Rates....	Led by Mike Mulligan
Chlorine Dioxide in Treatment of Water Supplies.....	Joseph A. McCarthy
Municipal Accounting.....	Paul Sandberg

### Southwest Section—October 16-17, 1945

Address of Welcome.....	Mayor Sam S. Caldwell
Response.....	Albert H. Ullrich
Postwar and Future Planning of Association Activities.....	Albert R. Davis
Business Management in the Operation of a Water Works Utility.....	Clyde E. Fant
Factors Involved in Underground Disposal of Fluids.....	Paul Weaver
Construction and Usage of Two 5-Mil. Gal. Concrete Storage Reservoirs As They Affect the Fort Worth System.....	W. S. Mahlie and Uel Stephens
Cross-Connections Service As an Added Feature to Distribution.....	A. M. Smith
Some Thought Bombs.....	Edward R. Stapley
Water Problems in Expanded Industrial Chemical Plant.....	A. P. Jones
Association Policies in General.....	Leonard N. Thompson
Public Relations in the Water Works Field.....	E. L. Filby
Electrical Terms and Maintenance of Electrical Equipment in the Water Plant.....	H. W. Blakeman
Experiences With Meter Practice Schools in Texas.....	W. A. Bandy
Meter Reading, Billing and General Commercial Practices Under Current Conditions.....	K. F. Hoeffe

### California Section—October 23-25, 1945

Practical Instructions in Inspecting Water Works Materials.....	H. Arthur Price
Practical Problems Involved in Employing Returned Servicemen.....	John I. Hennessy
Detecting Illegitimate Uses of Water and Providing Service Guards Against This.....	William Stava
Water Conservation Through Recovery of Waste Water for Industrial Use.....	Wm. J. O'Connell
Aquatic Weed Control.....	R. F. Goudey
Water Treatment at Eureka.....	Roy E. Coupal
The Economics of Treating Colorado River Waters.....	James M. Montgomery
Boiler Water Quality and Treatment.....	K. W. Brown
Sand and Sedimentation Prevention.....	O. A. Gierlich
Electrolysis for the Layman.....	Oliver C. Jensen
Symposium—A Look Into the Future.....	Samuel B. Morris, L. W. Grayson, Roy E. Dodson and L. L. Camy

### Ohio Section—October 23-26, 1945

Some Problems of Water Treatment From the Public Health Viewpoint.....	E. S. Hoyt
Postwar Self Analysis.....	Wendell R. LaDue
Maintenance Problems.....	A. A. Ulrich
Operational and Management Problems.....	Ira M. Hoover

**Missouri Valley Section—October 29-30, 1945**

Address of Welcome.....	Mayor John B. Gage
Response.....	W. Victor Weir
Panel Discussion—Distribution System Problems.....	Mark E. Driftmier, H. H. Kansteiner and C. E. Schanze
Panel Discussion—State Health Board Interest in Water Works Problems.....	W. Scott Johnson, T. A. Filipi and Paul D. Haney
Panel Discussion—Procedures Affecting Public Relations in the Water Works Industry.....	J. J. Hail, Andrew J. Reiff, Robert S. Millar and I. H. Reed
Panel Discussion—New Horizons in the Water Works Industry:	
Personnel and Management Problems.....	H. V. Pedersen
Trends in Sterilization.....	John A. Strang
Trends in Water Purification Practices.....	Herbert O. Hartung

**Illinois Section—October 30-31, 1945**

Address of Welcome.....	H. L. White
Functions of the State Health Department in the Water Works Industry.....	W. J. Downer
Guides and Checks to Good Operation.....	Louis R. Howson
Discussion.....	James Kerslake
Control of Dental Cavities (Caries) Through Feeding Sodium Fluoride in Public Water Supplies.....	Horace R. Frye
Discussion.....	Jerome C. Zufelt
Keeping Filters Clean.....	Walter A. Peirce
Discussion.....	James Myers
Discussion.....	Chester Miller
Round Table Discussion—Taste and Odor Control.....	Led by A. E. Anderson
Experiences in Break-Point Chlorination at Pontiac, Ill.....	James Murphy
Taste and Odor Control at Hammond, Ind.....	William J. Firth
Rehabilitation of Sandstone Wells.....	J. B. Millis
Discussion.....	Carl Duy
Discussion.....	Edward Wilson
Recovering Well Capacity With Chlorine.....	W. E. Huston and H. L. White
Problems of Sale of Water From One Municipality to Another	
From the Standpoint of the Purchaser.....	Andrew Frenzel
From the Standpoint of the Seller.....	W. H. Weigel
Customer Accounting at Oak Park, Ill.....	Marshall Dutton
Bacteriological and Chemical Analyses in Plain English.....	Eugene Clark
Discussion.....	Chester Domke
Description of the Design, Construction and Operation of the New Chicago Water Purification Plant.....	W. W. DeBerard, John Baylis and Fred Gordon

**North Carolina Section—November 5-7, 1945**

Address of Welcome.....	Mayor H. H. Baxter
Cleaning of Cast-Iron Water Mains.....	J. L. Greenlee
Plans for Developing the Division of Sanitary Engineering of the North Carolina State Board of Health.....	J. M. Jarrett
Preliminary Work on Fluorescence of Drinking Waters as Evidence of Sewage Pollution.....	Ruth McLean
Preliminary Report on North Carolina Plan for Fluorine Investigation and Control in Water Supplies.....	Lynn G. Maddry Sr.
Health and the Cycle of Water.....	A Motion Picture
Modern Trends in the Sewage Works Field.....	W. H. Wisely

Advantages of Cement Linings for Cast-Iron Pipe.....	Thomas F. Wolfe
Round Table Discussions:	
Water Works.....	<i>Led by Robert E. Stiemke</i>
Sewerage.....	<i>Led by S. R. Kin</i>
Chlorination Terminology.....	A. E. Griffin
Co-operative Health and Sanitation in the Americas.....	Harold B. Gotaas
Round Table Discussions:	
Management of Small Town Water Works.....	<i>Led by H. E. Thompson</i>
Sewage Works Operation.....	<i>Led by D. York Brannock</i>

### Virginia Section—November 8-9, 1945

Public Works Planning.....	Jas. A. Anderson
Roanoke City Water Works.....	Louis R. Howson
Mutual Interest of the League of Virginia Municipalities and the Virginia Section, A.W.W.A.....	I. G. Vass
Milestones Along the Road to Taste and Odor Control.....	W. A. Welch
Definition of Chlorination Terms.....	R. C. Clement
Discussion—U.S. Public Health Service Drinking Water Standards.....	<i>Led by J. K. Hoskins</i>
Some Problems of the Reconversion Period.....	Harry E. Jordan
Main Cleaning.....	Whitworth Cotten
Leak Survey.....	H. E. Beckwith

### Wisconsin Section—November 13-15, 1945

Address of Welcome.....	Joseph P. Schwada
Selling the Water Utility Locally.....	Leonard N. Thompson
Increasing Sale of Revenue Water.....	James Myers Jr.
Long-Range Planning.....	L. A. Smith
Treating Water With Fluorine to Prevent Teeth Decay.....	M. Starr Nichols
Cost of Living Index As a Basis for Fixing Wages.....	Ovid B. Blix
Checking the Distribution System.....	Harry Breimeister
General Discussion—Water Rate Schedules.....	<i>Led by Walter Peirce</i>
The Ground Water Situation in Wisconsin.....	L. F. Warriek
Panel Discussion—The Problem of Ground Water Level Recession.....	Arthur P. Kuranz, Harold L. Londo, M. F. Linnan, John W. Gibb, Arnold Lenz, E. F. Bean, F. T. Thwaites and L. A. Smith
Co-operation of the United States Geological Survey With State Authorities.....	A. G. Fiedler
Meter Maintenance and Repair.....	Harold L. Londo
Ranney Wells at Manitowoc, Wis.....	R. E. Cannard
Conditioning of Ground Water Supplies.....	H. M. Olson
Surface Water Supplies in Wisconsin.....	O. J. Muegge
Construction of Lake and River Intakes.....	Chas. B. Burdick
Chlorine Dioxide Water Treatment.....	John F. Synan
Design and Construction of Water Purification Plants.....	John A. Fulkman
Treatment of Surface Waters.....	J. J. McCarthy

### West Virginia Section—November 15-16, 1945

Address of Welcome.....	Mayor Russell Goodwin
Response.....	P. D. Simmons
Demonstration of Electronic Water Purification Process.....	Fred E. Stuart
Some Problems of the Reconversion Period Affecting Water Works.....	Harry E. Jordan

Public Relations in Water Works Management.....	Max K. Jones
The West Virginia State Water Commission.....	W. A. Buchanan
Water Treatment With Ferric Sulfate.....	J. B. Nickel
Experiences With Water Supply and Sanitation in the South Pacific.....	J. Paul Blundon
Handling Chlorine Safely.....	Robert R. Weber
The Chemical Engineers' Approach to the Industrial Waste Problem.....	John E. Tarman
Putting a Small Filter Plant Back on Its Feet.....	R. B. Parsons
Experimental Use of Fluorine in Public Water Supplies.....	Norman F. Gerrie
Automatic Operation Features of a Small Filtration Plant.....	E. H. Greenwald and H. E. Davis
Flow Analysis in Distribution Systems.....	H. R. Speiden
Proposed Federal Pollution Legislation.....	W. W. Hodge
Water Quality in the Ohio River at Wheeling.....	A. R. Todd

#### Florida Section—November 15-17, 1945

Address of Welcome.....	Mayor Herbert A. Frink
Address of Welcome.....	Thomas F. Smith
Response.....	G. E. Ferguson
Additions to Miami Water Supply System.....	C. F. Wertz
War Experiences of a Small Water Supply System.....	S. K. Keller
Water Supply and Treatment Problems at Sarasota, Fla.....	Wylie W. Gillespie
The Stellar Filter.....	F. A. Eidsness
Demonstration of Electronic Water Purification Process.....	Fred E. Stuart
American Water Works Association Affairs.....	Leonard N. Thompson
Conservation of Municipal Water Supply in Air-Conditioning Systems.....	N. C. Ebaugh
Water Conservation.....	A. P. Black
Water Supply in the Aleutians.....	Lynn Perry
Problems of Military Water Supply.....	David B. Lee

The following sections held meetings in affiliation with other associations and groups: Illinois Section and West Shore Water Producers Association; Michigan Section and Michigan Conference on Water Purification; Montana Section and Montana Sewage Works Association; New Jersey Section and South Jersey Water Superintendents; and North Carolina Section and North Carolina Sewage Works Association.

## Section Meetings—1941-1945

Section	1941	1942	1943	1944	1945	Meeting Place—1945
California	Oct. 22-24	Oct. 28-30	Oct. 27-30	Oct. 24-26	Oct. 23-25*	Los Angeles, Berkeley, Calif.
Canadian	June 23	Apr. 15-17	Apr. 7-9	Apr. 19-21	Mar. 19-21	Toronto, Ont.
Cuban	—	Feb. 17	Oct. 4	—	—	No scheduled meeting
Florida	Nov. 13-15	Nov. 12-14	Nov. 18-20	Nov. 16-18	Nov. 15-17	Miami Beach, Fla.
Four States	Nov. 5-7	Oct. 7-9	Oct. 14-16	Nov. 8-10	Dec. 13-15	Baltimore, Md.

\* Regular meeting canceled. Business meeting held at annual convention.

† No regular meeting scheduled. Membership given as of date of convention for 1941-44 and as of June 30, 1945.

‡ No record of attendance.

§ Only one meeting recorded here.

|| Joint meeting with New Jersey Section.

¶ Meeting not yet held.

## Re: Binding of the Year's Journals

Through the co-operation of the Library Binding Institute, an organization of binderies which specializes in binding publications into volumes, arrangements have been made to give information and assistance to A.W.W.A. members who want to have their JOURNALS bound. This work may be done in accordance with standards of materials and construction required for durability, service and accessibility by college, reference and public libraries. The American Library Association and the Library Binding Institute have co-operated in promulgating "Minimum Specifications for Class A Library Binding" based on research and production and performance experience.

A committee of the American Library Association has certified responsible and reliable library binderies which have proved able to meet these specifications. To obtain standard quality binding, simply request Class A binding at any certified bindery. In obtaining price quotations, state the three dimensions of the volume.

Names and addresses of certified binderies in your area are available from the Library Binding Institute, 501 Fifth Avenue, New York 17, N.Y. Before sending copies to the bindery:

1. Check for missing issues and check each issue for defects, missing pages, etc. Be sure to include the volume index.

2. Tie the twelve issues together carefully so that nothing is crumpled or torn.

3. Write out definite instructions giving your preferences on the following points:

- a. Color of binding (one of the following standard colors should be selected: dark green, dark blue, black, brown or medium red).

- b. Whether the advertising sections and/or paper covers are to be bound into the volume.

- c. An exact copy of the text to be lettered in gold on the backbone.

A common form is:

Journal—1 $\frac{3}{4}$ in. from top	Vol. 00—4 $\frac{1}{4}$ in. from bottom
--------------------------------------	---

A.W.W.A.—2 $\frac{1}{4}$ in. from top	1900—3 $\frac{3}{4}$ in. from bottom
---------------------------------------	--------------------------------------

- d. If you have had JOURNALS bound before and want your set to match as closely as possible, send a previous volume as a sample. If you want an approximate match, send a "rubbing" of the lettering on a previous volume and indicate the color.

If satisfactory arrangements cannot be made, or if there is any difficulty, advise the A.W.W.A. office and steps will be taken in co-operation with the Library Binding Institute to assure you proper service.

## Subject Index

### A

- Accounting; customer; methods used in, at Oak Park, Ill., 1273
- municipal; methods used in, at Denver, Colo., 1280
- Activated carbon; Chemical Warfare Service; study of suitability of, for water treatment, 239
- Aeration; high-pressure; reduction of chemical odors by use of, 1017
- Aftergrowths; bacteriological; use of copper sulfate in control of, 294
- Air-conditioning; rate problems caused by, 447
- Alexandria, Va.; survival and retirement experience committee report on, 1054
- American Water Works Association; audit of association funds for 1944, report of, 317
- Committee on Water and Sewage Works Development's policies on postwar planning, 470
- committee reports; pensions and retirement plans, 1119
- publications, 314
- survival and retirement experience, 647
- water works practice, 303
- membership statement for 1944, 321
- Secretary's letter to association membership, Jan. 31, 1945; erratum in, 288
- section meetings—1945, report of, 1395
- specifications; tentative; for deep wells, 913
- for sulfate of alumina, 1385
- statement of policy regarding grounding of electric currents on water pipes, 1298

### B

- Babylon, N.Y.; survival and retirement experience committee report on, 1239
- Backflow; protection against, 1162
- Back-siphonage connections; National Research Council's report on, 427
- Bacteria; iron; problems with, in deep well supplies, 1173
- study of, in water pipes, 52
- transformation of iron in water by, 963
- Base-exchange; as a means of water softening, 1004

- Beetles; predaceous diving; problems with, in Winnipeg water supply, 1204
- Bernoulli theorem; exposition of, 214
- Billing; meter; methods of, 375
- Boilers; treatment of feedwater in, 644
- Britain; new national water policy in, 442

### C

- California; cross-connection control and elimination in, 1159
- southern; industrial pollution in, causes of, 113
- Canada; relation of geology to ground water resources in, 84
- Carbon; activated; Chemical Warfare Service; study of suitability of, for water treatment, 239
- Cedar River watershed; relation of runoff and water quality to land and forest use in, 15
- Certification; *see also* Licensing
- history and program for, in California, 129
- program for, in Louisiana, 137
- Chemical injections; use of, in soil solidification and sealing leaking concrete, 849
- Chemical precipitation; as a means of water softening, 1004
- Chemical Warfare Service; study of activated carbons by, for use in water treatment, editorial comment on, 238
- Chlorination; for maintaining chlorine residuals, 869
- for removing tastes and odors, 869
- Chlorine; residual; maintenance of, by use of chlorine dioxide, 869
- Chlorine dioxide; treatment with, to solve various water problems, 869
- Cleaning; main; modern practices in, 189
- 36-in.; in District of Columbia, 199
- in New Jersey, 197
- 48-in.; in New Jersey, 192
- well; methods of, 109
- Clinton, Iowa; survival and retirement experience committee report on, 897
- Clyde, N.Y.; survival and retirement experience committee report on, 1216
- Coagulation; benefits derived from, 1305
- necessity of, in uprating McMillan filter plant, 276

- Complaints; customer; as a guide to better service, 1042
- Concrete; leaking; sealing of, by chemical injections, 857
- Conservation; ground water; by limitation of use, at Sparrows Point, Md., 289  
by pollution control, in Colorado, 291  
in Louisville, Ky., 543  
mineral resources, 281  
soil and forest resources, 280  
water; by domestic metering, in Rahway, N.J., 366  
Maryland policy regarding, 284  
program for, in Philadelphia, Pa., 66  
in Washington, D.C., 59
- Construction; postwar planning for, 224  
reservoir, 73, 1318
- Copper sulfate; use of, in control of bacteriological aftergrowths, 294
- Corner-cutting practices, 414, 417, 503
- Corrosion; caused by sulfur bacteria and sulfate-reducing bacteria in iron-bearing water, 977, 978  
consideration of, in planning future water works, 448  
steel pipe; prevention of, 249
- Costs; distribution system, 390
- Crenothrix*; loss of hydraulic capacity due to, 714, 1173  
treatment of well water to prevent, 715
- Cross-connections; American Water Works & Electric Company's policy concerning, 419  
American Water Works & Electric Company's supplement to rules and regulations covering, 422  
control and elimination of, in California, 1159  
under war conditions; National Research Council's report on, 427
- D**
- DDT; elimination of midge fly and other pests by use of, 1053, 1194  
removal of, from water supplies, 1310
- Deep wells; problems with iron in, 1173  
tentative specifications for, 913
- Denver, Colo.; survival and retirement experience; committee report on, 777
- Design; basic principles of, for prestressed concrete reservoirs, 81  
distribution system, 390
- Des Moines, Iowa; survival and retirement experience committee report on, 675
- Disease; water-borne; water department's liability for, 260
- Distribution systems; costs of, 390  
design of, 390  
flow analysis methods of, at Los Angeles, 379  
maintenance of, during wartime, 739  
duties of water works man regarding, 742
- District of Columbia; main rehabilitation by cleaning and cement lining in, 199
- Dry cells; apparatus for recharging of, 417
- E**
- Electrical currents; stray; problems with, water works industry's attitude on, 1298
- Electrical supplies; interruptions of, examples of, 41
- Electrodes; horizontal; advantages and disadvantages of, 253, 254  
vertical; advantages and disadvantages of, 255
- Equipment; operation and maintenance of, 1151, 1300  
sales engineers' viewpoint on tendering for, 1289
- F**
- Federal Communications Commission; May 25, 1945, report of radio allocations by, 638
- Feedwater; boiler; treatment of, 644
- Filter plants; rehabilitation of, 269
- Filters; future practice in design and construction of, 450  
maintenance of, 1301
- Financing; municipal water works; in Maryland, 863
- Flood control; dangers of, 345
- Florida; southern; salt water encroachment in, 526
- Flotation; water purification by, 302
- Flow analysis; distribution system; methods of, at Los Angeles, 379
- Fouling; caused by iron bacteria and non-specific bacteria in iron-bearing water, 965, 973, 1173
- G**
- Geist Reservoir; design and construction of, 1318
- Geology; ground water; in Louisville, Ky., area, 544  
in southern Florida, 527  
relation of, to ground water, in Canada, 94
- Green River watershed; relation of runoff and water quality to land and forest use in, 21

Ground water; conservation of, at Colorado, 291  
 at Louisville, Ky., 543  
 at Sparrows Point, Md., 289  
 interrelationship of, with surface water, 605  
 investigations of, by Geological Survey of Canada, 86  
 in North Carolina, 155  
 in Pennsylvania, 162  
 natural fluctuations of, interpretation of, 633  
 potentials of, in the Southwest, 165  
 problems of, in North Carolina, 156  
 in New Jersey, 563  
 relation of geology to, in Canada, 84  
 resources of, future of, in Pennsylvania, 163  
 sources of, in southern Florida, 529  
 Grounding; water works industry's attitude on, 1298

## H

Health; *see also* Disease  
 education program on, in Tennessee Valley, 336  
 problems of, in impounding water, in Tennessee Valley, 327  
 Huntington, W.Va.; survival and retirement experience committee report on, 1225  
 Hurricane; September 1944; damages caused by, in the Northeast, 505  
 experiences along New Jersey shore, 516  
 experiences in Nassau County, 512  
 Hydrants; installation of, 403  
 maintenance of, 1302  
 Hydraulics; exposition of Bernoulli theorem of, 214

## I

Institute, W.Va.; water treatment at, 209  
 Interconnections; American Water Works & Electric Company's supplement to rules and regulations covering, 422  
 Ion-exchange materials; application of, to water supplies, 1211  
 Iron; effect of bacteria on, in water, 963  
 problems with, in deep well supplies, 1173

## J

Jackson, Miss.; postwar program for, 724  
 Jar tests; fundamental technics of, 1207  
 Joints; packing for, methods of, to prevent contamination of mains, 47

## K

Kansas; appropriation of water for beneficial purposes in, 601

## L

Laboratory; chemical; problems solved by, 1144  
 Laboratory practice; trend toward physical methods of analysis in, 985  
 La Verne, Calif.; softening plant experiences at, 482  
 Law; *see also* Legislation  
 application of; to water-borne disease cases caused by negligence, 260  
 common; change from, in Kansas, 613  
 Kansas; 1945; re appropriation of water, 626  
 New Jersey; relating to water supply, 457  
 Lead; determination of, a photometric method for, 207  
 Leakage; location and elimination of, 1148, 1191  
 Legislation; pension and retirement; committee report on, 1119  
 Liability; *see* Law  
 Lining; cement; in District of Columbia, 199  
 in New Jersey, 196  
 modern practices in, 189  
 Licensing; *see also* Certification  
 advantages of, in Indiana, 132, 135  
 program for, in Arkansas, 127  
 in Oklahoma, 139  
 in Texas, 141  
 Louisville, Ky.; ground water conservation in, 543

## M

Mains; new; disinfection of, 46  
 rehabilitation of, by cleaning and cement lining, 191, 199  
 Maintenance; classification and control of, 267  
 distribution system; duties of water works man regarding, 742  
 meter; methods of, 377  
 plant equipment; problems with, 1151, 1300  
 postwar planning for, 224  
 problems of, during wartime, 739  
 Malaria; control of, in Tennessee Valley, 332  
 Maryland; municipal water works organization in, 863  
 policy of water conservation in, 284  
 Menasha, Wis.; decision of Wisconsin Public Service Commission re rates of, 1137

- Merrick, N.Y.; survival and retirement experience committee report on, 1249
- Meters; corner-cutting practices in repair of, 414
- domestic; conservation of water by installation of, at Rahway, N.J., 366
- maintenance of, 401, 1303
- reading of, 374
- selection and installation of, 373
- testing and repairing of, 377
- Micro-organisms; reduction of, 1307
- Midge fly; elimination of, from public water supplies, 1053, 1194
- Municipal water works; organization of, in Maryland, 863
- Mutual aid; program for, in New York State, 736

## N

- Nassau County; hurricane experiences in, 512
- National Research Council; report of, on cross-connections and back-siphonage connections under war conditions, 427
- New Jersey; ground water problems in, 563
- hurricane experiences along shore of, 516
- laws and rules relating to water supply in, 457
- rehabilitation of mains by cleaning and cement lining in, 191
- State Water Policy Commission; revised statutes on establishment of, 459
- New York City; water supply of, to outside communities, 754
- New York State; mutual aid program in, 736
- Nitrates; determination of, a photometric method for, 204
- Nitro, W.Va.; reduction of chemical odors at, 1013
- North Carolina; investigations of ground water in, 155
- Norwich, N.Y.; survival and retirement experience committee report on, 1344

## O

- Odors; *see also* Tastes and Odors
- chemical; reduction of, at Nitro, W.Va., 1013
- Ohio Valley; sources of recharge along, 145
- Ontario; postwar planning in, 729
- Operators; small town; relationship of, to village officials, 1267
- Ottawa, Ont.; survival and retirement experience committee report on, 654
- water treatment at, 640
- Outages; electrical; in water works plants, examples of, 41

## P

- Packing; joint; methods of, to prevent contamination of mains, 47
- Pennsylvania; investigations of ground water in, 162
- Pensions and retirement plans; committee report on, 1119
- Personnel; suggested policies and procedures for re-employing servicemen, 1021
- Pests; control and elimination of, in public water supplies, 1053, 1194
- Philadelphia, Pa.; program for water conservation in, 66
- Pipe; bacteriology of, 52
- mechanical joint; installation of and experiences with, at Richmond, Va., 362
- steel; causes and effects of corrosion in, 245
- Pipelines; control of surge in, 1036
- reconditioning of, at Wichita, Kan., 713
- Pitometer surveys; present-day scope of, 181
- Pollution; stream; control of, program for, in Tennessee, 354
- Postwar planning; British; Agriculture (Miscellaneous Provisions) Bill, interpretation of, 8
- British Waterworks Association on Control of Water Resources, first and second reports of, excerpts from, 4
- Committee on Land Utilization in Rural Areas, report of, excerpts from, 1
- Institution of Water Engineers, water supply report of, excerpts from, 6
- Labor party policy concerning, 11
- National Water Policy report to Parliament, excerpts from, 10
- Rural Water Supply and Sewerage Bill, excerpts from, 6
- Water Supply and Sewerage in Northern Ireland, report of, interpretations of, 8
- Committee on Water and Sewage Works Development's policies on, 470
- program for, in Jackson, Miss., 724
- in Ontario, 729
- prospects and promises of water works future, 445
- public utility expenditures for, 731
- Priorities; Order L-39; modification on hose couplings, 100
- Order U-1 as amended June 2, 1945, 643
- Protection; cathodic; precautions to be followed in applying, 258
- Public ownership; in Wellsville, N.Y., 452
- Public relations; in water works industry, 1270
- customers' complaints as a guide to better service, 1042
- Public service; importance of politics to, 1048

Publications; committee report on, 314  
 Pumps; centrifugal; problems with, 1029  
   tests of foot valves on, 70  
   electrical; problems with, 1166  
 Purification; promotion of fraudulent water  
   purifiers for, 1050  
   by flotation method, 302

## R

Radio allocations; Federal Communication  
   Commission's decision concerning, 638  
 Radio equipment; mobile; use of, to expedite  
   cleaning operations, 718  
 Rahway, N.J.; conservation of water in, by  
   installation of domestic meters, 366  
 Rates; water; need for revision of, 447  
   in some typical U.S. cities, 1130  
   modern schedules for, 1124  
 Recharge; determination of sources of, along  
   the Ohio Valley, 145  
   importance of, along the Ohio Valley, 150  
   sources of, in Louisville, Ky., area, 552  
 Red water; prevention of, in softening sys-  
   tems, 1006  
 Re-employment of servicemen, 1021  
 Rehabilitation; distribution system; by clean-  
   ing and cement lining, 189, 199  
   filter plant, 269  
   well; methods of, 101  
 Repair; *see* Maintenance  
 Reservoirs; design and construction of, 73,  
   1318  
 Residual chlorine; *see* Chlorine  
 Resins; synthetic ion-exchange; application  
   of, to water treatment, 1211  
 Richmond, Va.; experiences with mechanical  
   joint pipe in, 362  
 Rochester (Suburban), N.Y.; survival and  
   retirement experience committee report  
   on, 1361  
 Runoff; data on, in the Southwest, 173  
   relation of, to land and forest use, in Cedar  
   River watershed, 15  
   in Green River watershed, 21

## S

Safety; programs for, in Tennessee Valley,  
   336  
 Sag Harbor, N.Y.; survival and retirement  
   experience committee report on, 1355  
 St. Louis County Water Co.; corner-cutting  
   practices at, 414  
 St. Marys, Pa.; survival and retirement ex-  
   perience committee report on, 765

Salt water; disposal of, impounding reservoirs  
   for, 577  
   in Illinois oil fields, 573  
   in Texas oil fields, 569  
 encroachment of, control of, in Texas, 579  
   danger of contamination by, in southern  
   Florida, 531  
   in New Jersey, 565  
 Sedimentation; effects of, in McMillan filter  
   plant, 277  
 Sewage; treatment of, in Tennessee Valley,  
   341  
 Silicosis; control of, in Tennessee Valley, 333  
 Softening; municipal; development and prac-  
   tice of, 1002  
   problems with, 1301  
   use of synthetic resins for, 1211  
 Softening plants; municipal; 1944 census of,  
   585  
   operation experiences with, at La Verne,  
   Calif., 482  
 Soil solidification; process of, by chemical in-  
   jections, 849  
 Southwest; potentials of ground water in, 165  
   surface water resources of, 170  
 Specifications; tentative; for deep wells, 913  
   for sulfate of alumina, 1385  
*Standard Methods for the Examination of*  
*Water and Sewage*; recommended changes  
   for ninth edition of, 1341  
 Sterilization; pipe; examples of, 48, 294  
   well; methods of, 109, 1173  
 Storage; design of facilities for, 392  
 Stray currents; problems with, water works  
   industry's attitude on, 1298  
 Sulfate of alumina; tentative specifications  
   for, 1385  
 Surface water; sources of, in the Southwest,  
   170  
 Surge; control of, in pipelines, 1036  
 Surplus property; purchase of, by water works  
   industry, 1279  
 Survival and retirement experience; commit-  
   tee on; reports of, introductory state-  
   ment to, 647  
   committee report, Alexandria, Va., 1054  
   Babylon, N.Y., 1239  
   Clinton, Iowa, 897  
   Clyde, N.Y., 1216  
   Denver, Colo., 777  
   Des Moines, Iowa, 675  
   Huntington, W.Va., 1225  
   Merrick, N.Y., 1249  
   Norwich, N.Y., 1344  
   Ottawa, Ont., 654  
   Rochester (Suburban), N.Y., 1361  
   Sag Harbor, N.Y., 1355  
   St. Marys, Pa., 765

- Syracuse (Suburban), N.Y., 1374  
 Utica, N.Y., 874  
 Winnipeg, Man., 1069  
 Syracuse (Suburban), N.Y.; survival and retirement experience committee report on, 1374

## T

- Tanks; prestressed concrete; design and construction of, 73  
 Tastes and odors; caused by iron bacteria in iron-bearing water, 965  
   control of; *see also* Chlorination by coagulation, 1307  
 Taxation; municipal utility; Ohio Supreme Court decision on, 1293  
 Tendering; sales engineers' viewpoint on, 1289  
 Tennessee; stream pollution control in, 350  
 Tennessee Valley; public health problems in impounding water in, 327  
 Texas; control of salt water encroachment in, 579  
 Treatment; Chemical Warfare Service activated carbon; study of suitability for, 239  
   chlorine dioxide; to remove tastes and odors, 869  
   methods of, at Institute, W.Va., 209  
   at Ottawa, Ont., 640  
 Turbidity; removal of, by coagulation, 1306

## U

- Utica, N.Y.; survival and retirement experience committee report on, 874  
 Utilities; municipal; Ohio Supreme Court decision on taxation of, 1293  
   public ownership of, at Wellsville, N.Y., 452  
   rate structure for, decision of Wisconsin Public Service Commission re Menasha Water Department, 1137  
   water and electric; management of, 747

## V

- Valves; foot; tests of, on centrifugal pumps, 70

- installation of, at Winnipeg, Can., 402  
 maintenance of, 1302

## W

- WPB; Office of War Utilities; administrative letter, 643  
 Order M-38; as amended March 31, 1945, 469  
 Order U-1; Secretary's memo of May 17, 1945, on, excerpts from, 542  
 Orders L-39, L-154 (Schedule 1), L-211, L-252 and M-9-c-4; cancellation of, 511  
 "Summary of Policies" of, as of May 10, 1945, 576  
 Washington, D.C., program for conservation of water in, 59  
 Water and Sewage Works Development; committee on; postwar policies of, 470  
 Water hammer; causes and effects of, 32  
   tests of, 1031  
 Watersheds; relation of runoff and water quality to land and forest use in, 15, 21  
 Water works practice; committee report on, 303  
 Water works systems; small town; good business methods in, 1179  
   problems of, 1185, 1267  
 Wells; deep; tentative specifications for, 913  
   rehabilitation, cleaning and sterilization of, 101  
   yield of, in Louisville, Ky., area, 551  
 Wellsville, N.Y.; public ownership of utilities in, 452  
 Wichita, Kan.; restoring pipeline capacity at, 713  
 Winnipeg, Man.; predaceous diving beetles in water supply of, 1204  
   survival and retirement experience committee report on, 1069  
 Wisconsin Public Service Commission; decision of, on Menasha Water Department rates, 1137

## Z

- Zeolites; *see* Base-exchange

## Author Index

- ALLEN, CLARIS, design and construction of Geist Reservoir, 1318
- AMSBARY, FRANK C., JR., progress report on the use of copper sulfate in the control of bacteriological aftergrowths, 294

## NEWS OF THE FIELD

It appears that some water works men have not read as carefully as necessary the recently amended form of order U-1. This order gives the water works field preference ratings which are of value if properly applied and respected.

The order reads in part:

(1) A preference rating of AA-1 is hereby assigned to orders to be placed by a producer for material (other than controlled materials) in every class except (i) the transmission and distribution class and (ii) the meter class, for use in maintenance and repair, as operating supplies, and for minor plant additions.

(2) A preference rating of AA-1 is hereby assigned to orders to be placed by a producer for material (other than controlled materials) in (i) the transmission and distribution class and (ii) the meter class, for use in the repair of an actual or imminent breakdown.

(3) A preference rating of AA-3 is hereby assigned to orders to be placed by a producer for material (other than controlled materials) in (i) the transmission and distribution class and (ii) the meter class, for use in maintenance and repair, as operating supplies, and for minor plant additions, except where an AA-1 rating is assigned in paragraph (b) (2) above.

This means in simple language that water mains, fittings, valves, service line material, meters, etc., should be ordered only with an AA-3 rating assigned *except* when needed for the repair of an already existing or imminent breakdown.

Pumping station equipment, purification equipment and production equipment can be ordered with an AA-1 rating assigned.

The order has been mailed to every water works by the Office of War Utilities. In the interest of fair play in the war effort, it should be studied and followed.

(Continued on page 2)

(Continued from page 1)

**Marjorie Lovell Burgess**, Press and Public Relations Director of the British Waterworks Association and Asst. Editor of the Association's Journal, has become a member of the A.W.W.A.

In her letter of application, Miss Burgess tells her own story.

I am a fully qualified member of the Institute of Journalists. Before joining the staff of the B.W.A. I was Assistant Editor of B.R.C.S. Publications at the London HQS of the British Red Cross Society, and I have had wide and varied experience of journalistic and publicity work. I received my journalistic training as articled pupil of Mr. Arthur Beckett, F.R.S.L., the Sussex author and newspaper proprietor. I have had four books published and twice broadcast in our National programme.

After the war I hope to persuade the Executive Committee of the B.W.A. to let me visit America for a few weeks to study modern water supply and to give a series of lectures. It would be a great encouragement and inspiration to me to come as a member of your Association.

**The Annual Meeting of the Louisiana Engineering Society** will be held in New Orleans, La., at the St. Charles Hotel, on January 11-13.

## TIME TESTED

• • • Almost a half century of craft experience and user satisfaction confirms the outstanding excellence of SHELTON products . . . an excellence attested by the nation's leading schools, colleges, universities, hospitals and scientific departments of industrial plants. Continuous research and postwar planning add to the value.

Experienced SHELTON planning engineers are available, without obligation on your part, to help you prepare room layouts, compile budgets and write specifications. Wire or write.

MUSKEGON, MICHIGAN

**The skill that makes sea water  
drinkable for him...**

**L**ATEST example of Permutit's service to our country at war is the kit which takes the salt out of sea water to keep alive our flyers forced down at sea. After the war Permutit's long experience in water treatment will help to build a happier, healthier America. For instance, recent developments by Permutit\* make it more practical and economical than ever for municipalities to enjoy good water supplies—free of hardness, dirt and iron.

Many cities have put good water at the top of their lists of post-war improvements. Plan it now for *your* community! Write for full details to The Permutit Company, Dept. G2, 330 West 42nd St., New York 18, N. Y. In Canada: Permutit Company of Canada, Ltd., Montreal.

**R. M. Leggette**, formerly in charge of the U.S. Geological Survey's ground water investigations in New York and New England, has opened an office as a consultant in ground water geology at 551 Fifth Ave., New York, N.Y.

Leggett, a graduate of the Univ. of Chicago, had been with the U.S. G.S. for fourteen years when he was commissioned in the Corps of Engineers in July 1942. He spent nineteen months in Algeria and French Morocco as Water Supply and Sanitation Officer of a large area where water supply for the Army was critical.

The former major has published a number of reports for the U.S.G.S. and has written for this JOURNAL. He is a member of the A.W.W.A. and a fellow of the Geological Society of America and of the Geophysical Union.

**Milo F. Ohr** has joined the firm of Giffels & Vallet, Inc., Engrs., in Detroit, after having been engaged for the past four years on various engineering projects for the Army, the Navy and the Marine Corps in the South and the Southeast.

# *Copper*

## FIRST CHOICE FOR WATER SERVICE LINES

PRIOR to wartime restrictions, many communities were using copper tube exclusively for both new and replacement service connections. Its ease of installation, corrosion resistance and long service life have given copper tube an increasing following among public and private water department officials.

Copper tube, under normal conditions, provides as nearly permanent service connection as can be had from any commercial metal. With copper tube, maintenance costs are reduced considerably, and permanent improvements to roadways, pavements and landscaping can be instituted—free of the threat of subsequent openings which less durable piping might necessitate.

Today, war needs get first call on all copper and brass. When these restrictions are lifted, Anaconda Copper Tube will once more be available for public and private water service projects.

(Continued from page 4)

**Charles R. Henderson**, Past President of the A.W.W.A., died on November 29 after a brief illness, in Pittsburgh, Pa., where he had been residing with a daughter.

Mr. Henderson was born in London in 1870, and emigrated with his family to St. Louis when he was twelve years old. Two years later he moved to Quincy, Ill., where, at the age of seventeen, he started in the water works business. After eleven more years, he went to Mexico to engage in ranching and mining. In 1905, he returned to the U.S. and went back into the water supply industry at Waterloo, Iowa. In 1909, he was appointed general manager of the Davenport, Iowa, Water Co., and served in that capacity until he retired ten years ago. Under his direction, the Davenport Water Co. became one of the pre-eminent supplies in the country.

Mr. Henderson was Vice-President of the A.W.W.A. in 1908 and in 1913, on the Executive Committee from 1909 to 1912, and in 1920-21, a Trustee from 1914 to 1916, and President in 1919. He helped establish both the Illinois and the Missouri Valley Sections of the A.W.W.A., and for his many services to the Association and to the field of water supply he was made an Honorary Member in 1936.

**Frank Raab**, Chairman of the Minnesota Section in 1943-44, and Chemist and Bacteriologist in the Minneapolis Water Dept. for 24½ years, has retired and is now living in Custer, Okla. Before Raab went to the Minneapolis Water Dept. he was employed by the Minnesota Dept. of Health, Div. of Sanitation, for twelve years.

If you've been limping along with a water supply of inferior quality or are having difficulty with obsolete or troublesome water treating equipment, %Proportioneers% Heavy Duty Chem-O-Feeder is just what the doctor ordered.

Heavy Duty Chem O Feeder.  
 Capacity to 7 G. P. H. against 85 lbs.  
 per sq. in. pressure.

This economical pump is designed to feed all water treating chemicals. It does not require an expert operator and its feeding rate is instantly adjustable. Modern design, with long-lived diaphragm and See-Thru plastic head for visible feed, assures long, trouble-free service. Send for Bulletin SAN-2.

**Donald D. Gold**, Chemist and Bacteriologist at the filtration plant at St. Paul, Minn., who was commissioned a 2nd Lieutenant in the Medical Corps in November 1943, is now on duty on a hospital ship.

Lieutenant Gold was graduated from the Univ. of Minnesota in 1940, and went to the St. Paul Water Dept. shortly after that. He was successively Asst. Chemist, Chemist and Bacteriologist, and Acting Supt. of the Filtration Plant during Supt. Ross A. Thuma's service as Major in the Corps of Engineers.

A glossary of foreign welding terms published by the American Welding Society is now available to supplement standard or engineering dictionaries. Contractors, students and others who may have occasion to consult welding drawings or specifications using German, French, Russian or Spanish terms will find the glossary valuable. Many of the terms for which English definitions or equivalents are given have been derived from foreign technical literature and are not found in any standard or technical dictionaries. The glossary is published as a paper-covered pamphlet of 16 pages. The price is 50 cents and it may be purchased from the American Welding Society, 33 West 39th St., New York 18, N.Y.

(Continued on page 12)

## SAVE FOR VICTORY

**EVERYWHERE** Americans are being asked to "SAVE FOR VICTORY." Water works superintendents, engineers and public officials can do more in this connection by investigating the National Method of water main cleaning. This method restores the carrying capacity of pipe to at least 95 per cent of that of new mains, thereby eliminating the necessity for purchase of new mains. Aside from this the National Method makes possible lower pumping costs, greater delivery, reduced insurance rates and clean water.

*Now is the time to do your part—SAVE FOR VICTORY*

# Attention!

## WATER WORKS OFFICIALS

The letter reproduced herewith tells its own story—Mathieson's new Chlorine Dioxide water-treatment technique is no longer in the experimental stage. When Mathieson Sodium Chlorite—from which Chlorine Dioxide is generated—is again available in quantity after the war, many other communities will be able to enjoy the advantages of this amazing technique for removing objectionable tastes and odors. Full information will be sent upon request.

# Mathieson

CHLORINE DIOXIDE

CITY OF NIAGARA FALLS  
NEW YORK

FROM H. W. Clark, City Manager

DATE October 20, 1944

TO Mr. George W. Dolan, President  
The Mathieson Alkali Works, Inc  
60 East 42nd Street  
New York, N. Y.

Dear Mr. Dolan:

On behalf of the administration of the City of Niagara Falls, New York, I am taking this means of expressing our satisfaction over the present quality of the municipal water supply.

The chlorine dioxide treatment developed by the technical staff of your organization has been applied to the entire pumpage here for the past five months. During this time the elimination of objectionable tastes and odor from the water supply has been maintained at a high level of performance.

It is my belief that your company has made an outstanding contribution to water works practice.

Very truly yours,

H. W. Clark, City Manager

(Continued from page 10)

The 1944 edition of the American Foundrymen's Association's *Cast Metals Handbook*, an extensive revision from the previous edition (1940), deals exclusively with the engineering properties of cast metals and has been prepared especially for use by those who design metal parts and who specify or purchase case metals for industrial products.

The book includes considerable information of value to designers of castings, showing numerous examples of specific structures where re-designing has made possible a greatly improved cast product. A section also is devoted to the significance of strength and ductility tests of metals, covering such tests as resistance to fracture, creep strength, hardness, static and dynamic ductility, corrosion fatigue, wear, etc.

Separate and extensive sections deal with steel, malleable iron, cast iron, and the non-ferrous alloys, all technical data included having been brought up to date in the light of cast metals developments made since publication of the previous edition. The book is intended for long-range use rather than simply to cover specifications made necessary by wartime shortages of and restrictions on metals. However, conforming specifications (A.S.T.M., Federal, Navy, S.A.E., A.M.S. and Bureau of Ships) are shown for both ferrous and non-ferrous products.

Extensive bibliographies are included for each of the various cast metals sections, with the many references to both American and foreign foundry practices adding to the value of the book for research purposes.

The *Cast Metals Handbook* has long been recognized as a standard treatise on the engineering usefulness of all cast metals, and as such should be of interest and value to all mechanical, product and designing engineers. It is available from the American Foundrymen's Association, 222 West Adams St., Chicago 6. The cloth bound volume contains 745 pages, 258 illustrations and 204 tables and costs \$6.00.

## Modern Products That Every Water Works Man Should Know

### CHEMICAL DIVISION

#### ★ ACTIVATED ALUM

America's most popular water works coagulant. Write for Bulletin No. 28.

#### ★ ACTIVATED BLACKALUM

(Compounded activated carbon coagulant).

For coagulation with taste and odor control. Write for Bulletin No. 29.

#### ★ ACTIVATED CARBON

For taste and odor control. Write for Bulletin No. 30.

### MACHINERY DIVISION

#### ★ PALMER SURFACE WASH SYSTEMS

Increases plant capacities; eliminates mud balls; saves wash water. Designed, furnished and installed. Write for Bulletin No. 38.

#### ★ STUART WALKING-BEAM FLOCCULATORS

No bearing surfaces under water. Write for Bulletin No. 39.

#### ★ ADJUSTABLE VENTURI THROAT DISTRIBUTING WALLS

Regulates velocities thru settling basins; prevents short-circuiting. Write for Bulletin No. 40.

#### ★ STUART "HI-CAPACITY" INDUSTRIAL FILTER WITH TWO-STAGE SURFACE WASH

For high capacity filtration. Will reach 9 gals. per sq. ft. per minute. Write for Bulletin No. 41.

**STUART-BRUMLEY CORP.**  
516 N. CHARLES ST. BALTIMORE-1, MD.

(Continued from page 12)

**St. Lawrence County**, in northern New York State abutting the St. Lawrence River, is experiencing a water shortage which has resulted from shifts in ground water flow which followed more than a score of earthquakes which occurred this fall. The New York Times reports:

Only a minority of the some 4,500 farms situated in this grassland area along the St. Lawrence River and the Valleys of rivers flowing north from the Adirondack Mountains into the St. Lawrence are believed affected.

The earthquakes are changing the veins underground in many cases, so that drilled wells and springs have gone dry as the water flowed in new directions. . . . The president of the Farmers' Union of St. Lawrence County has issued an appeal for 1,000 well drillers to start operations in the county to rectify the situation.

Water is being drawn in milk-tank trucks and milk cans from the areas where it is still abundant to the areas where the shortage is greatest. All the milk stations in the county are helping as far as possible in keeping a water supply flowing to farmers.

The problem is looked upon as one of finding a sufficient number of well drillers, rather than as a minor catastrophe. The cost of hauling water varies from nothing in some cases to a general average of two dollars a cow a month.

St. Lawrence County is one of the key areas in the milkshed supplying the city of New York.

(Continued on page 16)

### Culture Media Ingredients

This group of Difco Products is prepared expressly for use as ingredients of bacteriological culture media. Each product is carefully tested and standardized to meet the most rigid requirements of usefulness for the purposes for which it is to be employed.

**Bacto-Beef Extract**, approved in "Standard Methods of Water Analysis."

**Bacto-Peptone**, also approved in "Standard Methods."

**Bacto-Oxgall**, especially recommended for preparation of bile media.

**Bacto-Lactose**, a highly purified product recommended for use in many media for presumptive detection of coliform bacteria.

**Certified Dyes**, for use in culture media, include Bacto-Basic Fuchsin (DF-8), Bacto-Brilliant Green (DBg-2), Bacto-Crystal Violet (DC-4), Bacto-Eosin Y (DE-4) and Bacto-Methylene Blue (DA-6).

Specify "DIFCO"

**DIFCO LABORATORIES**

**FOOD PACKERS KNOW US** as builders and designers of equipment for processing, canning and packing nearly every type of food.

**PRODUCE GROWERS, Shippers & Dealers** know us for fresh fruit & vegetable protective processes, such as Hypo-Chlor & Flavorseal.

**FIREMEN KNOW US** as the makers of FMC Original Fog Fire Fighters which produce a dense fog for extinguishing fires almost instantly.

## WHO IS Food Machinery Corporation?

**FARMERS KNOW US** as makers of Bean Orchard and Crop Sprayers, Niagara Insecticides and Dusting Machines, Peerless Pumps, etc.

**CITY ENGINEERS KNOW US** as builders of Peerless Pumps, supplying water for city systems as well as for industrial and farm uses.

**THE ARMED FORCES KNOW US** as builders of "Water Buffalo" amphibious tanks and other war equipment.

Food Machinery Corporation is many things to many people. Ten manufacturing divisions with fourteen major factories located from coast to coast make hundreds of different products in diversified fields. But *all* FMC equipment is known alike for its excellence of design, its superior engineering and mechanical stability. At the root of this reputation is an exceptional "know-how" that is the result of more than sixty years of building specialized equipment and solving difficult engineering problems for the food and other industries.

**Proportioneers, Inc.**, Providence, R.I., has announced the introduction of a Diatomaceous Earth Filter, developed with the co-operation of the U.S. Navy. It is designed for use in conjunction with Proportioneers' Pur-O-Pumper, and the company describes it as producing perfectly clear, potable water quickly and in large quantities, and of particular value in portable equipment, where its compactness, light weight and purifying powers offer many advantages over ordinary sand filters.

**Northrop & Co., Inc.**, has issued a catalog describing Bond-O, a self-calking jointing compound made with a sulfur base and used to joint cast-iron bell-and-spigot water pipe. The catalog gives instructions for using Bond-O, and an inspection test and a measured leakage test are defined. Tables are supplied showing wall thicknesses and weights of centrifugally-cast pipe, followed by a table showing pounds and depth of Bond-O required per joint for pipe diameters ranging from 4 to 60 in., as compared to lead requirements for the same diameters. Another table shows pounds of Bond-O required per 1,000 ft. of pipe. Bond-O furnaces and other equipment are listed in the catalog. Northrop & Co., Inc., is located at 50 Church St., New York 7, N.Y.

## THERE'S A STRING OF THEM NOW

### ACROSS THE COUNTRY

**Producing Clear, Soft, Iron-Free  
Water for Many Municipalities**

When it's reconversion time, there will be new materials, methods and ideas to be developed and perfected and molded into useful equipment . . . equipment which eventually will find application in important beneficial public works improvements.

In the Water Conditioning Field, however, there is no need to wait for this "miracle" equipment to materialize because

ACCELATORS had already gone through the developing and trying-out stage before the war. There's a string of municipal Accelator installations across the country now

ACCELATORS are doing a lot of different things for a lot of different kinds of water . . . clarifying . . . softening . . . stabilizing . . . removing color . . . taking out iron.

Results are always excellent . . . frequently remarkable.

You can't beat ACCELATORS for Performance and Economy. Would you like Bulletin 1824?

## VIRGINIA SECTION

The Eleventh Annual Conference of the Virginia Section and the third wartime meeting was held at the John Marshall Hotel, Richmond, Va., Nov. 14 and 15, 1944. Registration totaled 161 delegates and guests.

"Reading of Meters and Collection of Water Bills" was presented by W. B. Harman, Asst. Gen. Mgr., Newport News Water Works Com. He stressed the importance of correctly reading meters and maintaining a history or log of each meter. He also explained savings due to quarterly reading and billing of meters under 1 in. in size.

In his paper "Testing and Repair of Meters," A. T. Lundberg, Chief Engr., Water Dept., Arlington County, Va., summarized many previously published articles on meter repairs.

Seth Burnley, City Mgr. of Charlottesville, discussed "Installation of Services and Selection of Meters" and advised that the size of large meters could best be selected by determining the maximum requirements of the consumer and accepting the rating of the manufacturer of the meters.

"Experiences With Mechanical Joint Pipe" was the title of the paper by E. R. Sharp, Chief, Bureau of Gas and Water Distr., Richmond. The author explained the advantages of mechanical joint pipe in water distribution mains and gas mains.

I. N. Glace, Con. San. Engr., Harrisburg, presented a paper entitled "Prospects and Promises—An Attempt at Crystal Gazing." He predicted problems that confront the water works field, among which were a major dispersal of population, involving administrative problems, rate changes, effects on quality and possible use of dual mains; impact from air-conditioning developments and problems of corrosion and sloughing in old mains and correction of new mains in outlying extensions, such as suburban and rural installations.

"Chlorination Experiences at Norfolk, Va.," was the subject of a paper by S. M. Hodges, Chemist, 37th Street Purification Plant, Norfolk. He described troubles overcome by super-chlorination.

In a paper describing small water supplies along the C. & O. Railroad, H. E. Silcox, Asst. Engr., Water Supply Div., C. & O. Railroad, pointed out the types of water supplies used by communities due to their geographical location.

C. L. Crockett, Chemist, N. & W. Railroad, Roanoke, presented a paper "Eliminating Tastes and Odors From River Supply," in which he described treatment of water from a surface supply containing phenolic compounds.

The recipient of the Fuller Award was Richard Messer, Director of Bureau of San. Eng., Virginia State Health Dept. The citation reads:

(Continued from page 18)

"In recognition of his unassuming but outstanding contribution to the public health of the Commonwealth of Virginia through the promotion of improvement in the quality of potable water supplies, and for his modest but valuable leadership in the formation and successful operation of the Virginia Section."

The following resolution was adopted by the Section:

"WHEREAS, the shortage of suitable water now available for use for industrial and domestic purposes supplied from both public and private water systems is known to create a threat of extreme seriousness, and

"WHEREAS, because of this threat every proper effort should be made to lessen the demands for water, particularly during the times of maximum use, and

"WHEREAS, refrigerating equipment is normally in greatest demand at the same time at which the total water demand for other purposes is also at its maximum, and

"WHEREAS, the amount of water used as a part of the operation of such refrigerating equipment can be greatly reduced or eliminated by the installation and the operation of equipment both simple in design and of comparatively low operating and maintenance cost.

"THEREFORE BE IT RESOLVED by the Virginia Section of the American Water Works Association, assembled at its annual business meeting in Richmond, Va., Nov. 14, 1944, that it recognizes the aforesaid threat created by existing and proposed water-cooled refrigeration, and

"BE IT FURTHER RESOLVED, that it is the opinion of the Virginia Section of the American Water Works Association that until such time as other action shall be taken by the American Water Works Association, it recommends that no water utility should supply water from the public distribution system for any new, additional or enlarged refrigeration at a rate in excess of five one-hundredths (0.05) of a gallon per minute per ton of refrigeration being installed or enlarged, and

"BE IT FURTHER RESOLVED, that the Secretary of this Section be directed to send a copy of these resolutions to the Secretary of the American Water Works Association and to the responsible heads of each of the public water supplies located in the area constituting this Section."

WITH the gradual relaxation of priorities, copper is becoming available for water service. Hays, a pioneer in the development of copper pipe services, has developed and built a complete line of stops and fittings for use with copper pipe. The use of copper pipe and Hays Radius Seal Joints eliminates much labor in installation. It simplifies the making of tight, vibration proof connections which together with its long functional life, without attention or replacement, provides the utmost in economy.

Illustration shows a Hays corporation stop with Hays Radius Seal Joint. This popular joint features a 45° machined seat and pipe flare and is available directly on Hays Corporation and Curb Stops, Service Connections, Goosenecks, Branches, Adapters, Stop and Drains, etc. All Hays Radius Seal Fittings are interchangeable with other makes. Dimensional accuracy and uniformity of threads permits the use of Hays Brass in any standard tapping machine. Hays Water Service Brass Goods Catalog shows illustrations and gives full descriptions. ## AS CITIES GROW-

### WATER SYSTEMS MUST BE EXPANDED

The growth of cities and towns will ever continue. For every thousand increase in population, there will be a need for more water.

Water Systems must keep a step ahead of the need. They should be of the finest quality and highest efficiency. Furthermore repair and maintenance service must always be obtainable.

For absolute dependability, you will choose Layne Systems. They have scores of years of proven service with hundreds of municipalities, industries, war camps and ship yards. Their records of long life and low upkeep cost have never been equaled.

Right now Layne is offering the co-operation of their engineers on postwar planning. If you are facing an increased water supply problem, write for details, literature etc.

# GENERAL CHEMICAL "ALUM"

## ... EQUALLY EFFICIENT FOR COAGULATION OF *WATER and SEWAGE!*

Today, aluminum sulfate is almost universally accepted by water experts as the best coagulant for the removal of turbidity, color and bacteria from water . . . and General Chemical Aluminum Sulfate is the outstanding choice the nation over. The reason? Operating men have come to rely on its high quality and constant uniformity, knowing that the effectiveness of General Chemical Alum has been "proved in the settling basins" year after year in

towns and cities all over America.

Municipal officials in charge of sewage disposal find that clarity and purity of sewage effluent are also easily obtainable with General Chemical Aluminum Sulfate because of the many reasons noted below. Why not join the majority of American cities that prefer General Chemical Alum—and specify "General" for *your* water works and sewage disposal systems? Ask any Technical Service Office for details.

### ★ FOR WATER WORKS

1. Produces crystal-clear water.
2. Gives better floc formation resulting in longer filter runs.
3. It is a low-cost coagulant.
4. Has no chlorine demand, conserving chlorine exclusively for disinfection.
5. Superior in tests against other coagulants.
6. High in quality, its constant uniformity can be counted upon.
7. Aids in the reduction of tastes and odors.

### ★ FOR SEWAGE PLANTS

1. Clean, easy to handle, dry feeds well, and economical to use.
2. Simple application, requires only low cost feeding apparatus and minimum attention.
3. Clear, colorless effluents are possible.
4. Sludge digests readily.
5. Treated digested sludge dries quickly, with a minimum of odor.
6. Chlorine consumption is cut due to lower demand of clarified sewage.

# 5 PIPE POINTERS For Postwar Plans

When you specify ARMCO Spiral Welded Steel Pipe for new peacetime water mains you are assured these five big advantages:

## 1. Low Installation Cost

Hauling, handling and installation costs are lower; ARMCO Pipe is amply strong without excess weight. Long 50-foot sections mean fewer joints, less assembly work.

## 2. High Flow Capacity

Its spun enamel lining prevents tuberculation—assures highest possible flow capacity.

## 3. Less Leakage

Strong tight joints are assured with any type coupling or by field welding.

## 4. Freedom from Breakage

ARMCO Pipe stretches 25 to 30 per cent before breaking.

## 5. Low Cost Per Year

In the long run ARMCO Pipe costs less per year because of its efficient, reliable service. You can specify it with assurance that it will last as long as you need it.

★ ★ ★

Diameters of ARMCO Pipe are from 6 to 36 inches; wall thicknesses from 7/64 to 1/2-inch. Write us for more information. The American Rolling Mill Company, Pipe Sales Division, 1811 Curtis Street, Middletown, Ohio.

EXPORT: THE ARMCO INTERNATIONAL CORPORATION

# COMPLETE SELECTION in Socket Fittings!

Every type of socket fitting needed for water works construction and maintenance is included in Grinnell's line.

Special features of Grinnell Socket Fittings:

1. Improved design cuts size and weight and lessens friction losses.
2. All socket and spigot dimensions and wall thicknesses are the same as A.W.W.A. Standard Class "D" Pipe.
3. All fittings suitable for use with Super-deLavaud centrifugally cast Bell and Spigot Pipe.
4. Although listed for only 150 lbs. working pressure, suitable for 173 lbs. water pressure as specified for A.W.W.A. Class "D" Fittings.

Write for Catalog 1,  
"Water Works Specialties".

WHENEVER PIPING IS INVOLVED

(Continued from page 20)

**CALIFORNIA SECTION**

The Twenty-fifth Annual Meeting and Third Wartime Conference of the California Section was held October 24 to 26, at the Biltmore Hotel, Los Angeles, Calif. There was a total registration of 926, slightly exceeding that of 1943.

The program was planned on the basis of answers to a questionnaire regarding preferences in subject matter on the part of members of the California Section. The result was an interesting program, with an unusually large attendance at all sessions.

The Fuller Award was given to George C. Sopp, Meter and Service Dept. Supt., Dept. of Water and Power, Los Angeles, Calif.

Maj. Rolf Eliassen, Repairs and Utilities Div., Corps of Engineers, Fort Douglas, Utah, spoke on "Some Interesting Observations of Water Treatment Practices." Water supply at the military installations has presented some unusual problems and it is the general policy of the military to secure its water from cities or other available existing supplies if this can be arranged, but where that is impossible water works men, both military and civilian, have had to employ resourcefulness and ingenuity to solve the problems.

Water Purification Equipment

(Continued from page 38)

Major Eliassen stated that on some of the Caribbean Islands, for instance, supplies were short and runoff is collected from airport runways; it was also necessary to distill sea water. In a western area 2,000,000 acres of "nothing" is used as a bombing range. There the railroad and army share an existing water supply—frequently requiring trains to be held over until the water tanks are filled.

Charles Gilman Hyde, Prof. Emeritus, San. Eng., University of California, Berkeley, Calif., spoke on "Water Purification—Some Reminiscences." Professor Hyde's address included an historical summary of the science of water engineering. During Professor Hyde's career in teaching, he started more than 200 engineers in the water works field.

Professor Hyde presented a hitherto unpublished story of an extensive outbreak of gastro-enteritis in the City of Alameda, Calif., in February 1909, caused by polluted water from wells having defective casings.

A symposium on the U.S. Public Health Service Drinking Water Standards was held, with the following contributions being made:

"Applying the Revised Drinking Water Standards," by J. K. Hoskins, Asst. Surgeon Gen., U.S. Public Health Service, Washington, D.C.

(Continued from page 40)

"The Part the State Dept. of Public Health Plays in the Certification of Water Supplies for Use on Common Carriers," by C. G. Gillespie, Chief, Bureau of San. Eng., State Dept. of Public Health, Berkeley, Calif.

"Practical Aspects of the U.S. Public Health Service Drinking Water Standards from the Water Works Standpoint," by R. F. Goudey, San. Engr., Dept. of Water and Power, Los Angeles.

Hoskins brought out that the U.S. Public Health Service is required to certify the safety of drinking water offered by common carriers for the use of passengers carried in interstate traffic. This responsibility is nationwide, and there were developed in 1914, revised in 1925 and again in 1942, standards designed to meet the requirements of a safe drinking water.

The committee recognized, and clearly stated in their reports, the inadvisability of a "rigid and automatic" application of the standards and specifically counseled that the certifying authority exercise judgment and discretion in applying the standards. But, regardless of this co-operative approach, considerable apprehension has been expressed in some quarters as to the meaning and intent of certain statements in the latest revision, the rigidity of some of the requirements and the possible legal interpreta-

tions that may be placed upon certain sections to the detriment of the water purveyor.

The Public Health Service takes the attitude that the standard should apply to the product and that the consumer should be protected by the agency having jurisdiction over the water system delivering such product.

C. G. Gillespie stated that the California Dept. of Public Health has been the "Reporting" agency to the U.S. Public Health Service since the beginning of certification in 1914, and he explained that the chore of annual surveys, analyses and certification often lead to short-cuts in getting out the annual reports. The Public Health Service frowned upon these short-cuts, notwithstanding that the imposition of the task on the state engaged far too much time and talent and diverted precious manhours from other more vital State Health work. In spite of this fact the state has gone along with the Public Health Service, partly because their system helped with regard to certain defects but mostly to avoid duplication and the confusion that would result with double standards. The new 1942 standards threw a heavier load on the state, allowing less time to be devoted to water works and therefore placing a greater responsibility on water works superintendents whose waters are used on common carriers.

*(Continued from page 44)*

R. F. Goudey asserted that the water works superintendent is legally and professionally responsible for the delivery of safe water and has a far greater interest and pride in this responsibility than has any state or federal agent. This attitude, he said, is fundamental, and should be reason enough to supplant present coercive regulations with businesslike and common sense educational approaches so far as improved water safety is concerned.

It was concluded by the symposium that it would be desirable to have the Drinking Water Standards altered to include two sections, namely: first, those health hazards, bacteriological, physical and chemical sections which are intolerable from a health standpoint, and second, those bacteriological, sanitary, physical and chemical limits which it would be desirable not to exceed.

Fred D. Pyle, Hydraulic Engr., Water Dept., San Diego, Calif., gave a paper entitled "The Influence of War on Design of Water Facilities for San Diego," which discussed supply and purification problems arising out of the present emergency and described how they were handled by the city.

In "The Corrosion of Steel and Its Mitigation," W. R. Schneider, Asst. Engr., Pacific Gas & Electric Co., Oakland, Calif., limited his dis-

*(Continued from page 46)*

cussion to the corrosion of steel pipes under water and buried in the soil. The causes of such corrosion and various methods for protection were defined.

W. J. O'Connell, Jr., Technical Consultant, San Francisco, presented a paper entitled "Trends in Licensing Professional and Sub-Professional Water Works Employees and Unionization."

Col. Rufus W. Putnam, C.E., U.S. Engineer Office, Los Angeles, spoke on "Late Developments in U.S. Army Water Supply Methods at Home and Overseas." In the course of his discussion he brought out that the development of water supply is the No. 1 problem for the military engineer, whether it be for a training camp at home or for troops in combat overseas.

The development, purification and transportation of water overseas is a function of the engineer water supply battalion assigned to any Army. A water supply battalion consists of about 500 officers and men and equipment consisting of 15 water transportation units, six 750-gal. tank trucks and 9 purification trucks. In addition, the battalion has eighteen 3,000-gal. capacity canvas tanks and six 260-gal. capacity canvas basins. The purification unit is a truck-mounted filter plant with a capacity of about 90 gpm. Ammonium aluminum sulfate is utilized for coagulation, sodium carbonate for pH control and sterilization is effected by liquid chlorine. For smaller isolated groups a portable purification unit using hypochlorites and having a capacity of 15 gpm. is used.

In "Operation and Maintenance of Water Treatment Plant Appurtenances," Carl M. Hoskinson, Chief Engr. and Acting Supt., Div. of Water and Sewers, Sacramento, Calif., said that he believes that the operation of any piece of equipment is not beyond the limits of average intelligence, whereas the repair after breakdown and maintenance after an original failure sometimes taxes the imagination and ability of capable mechanics. He therefore devoted the paper to a discussion of the problems which arise in keeping equipment in running order.

(Continued from page 48)

James M. Montgomery, Cons. Engr., Los Angeles, read a paper on "Disposal of Softening Plant Wastes," in which he described the chemical reactions in each of the three most common softening processes, the waste products produced and a variety of means of disposal.

Lee Streicher, Chief Chemist, Metropolitan Water District of Southern California, gave a paper on "Operating Experiences at LaVerne Softening Plant; Experimental Work." He described operating problems at this great terminal reservoir of the Metropolitan Water District's Colorado River Aqueduct and the experimental work being done on the control of corrosion and on the new process of electrolytic treatment of water.

Paul F. Bovard, Mgr., California Filter Co., San Francisco, Calif., presented a paper entitled "Application of Ion Exchangers." He showed that by the use of ion exchangers it is possible to produce a water equivalent to distilled water and comparable in cost.

A paper on "Softening Water for Oil Field Purposes" was presented by F. T. Willis, Supervising Foreman, Chanslor-Canfield Midway Oil Co., McKittrich, Calif.

Carl Wilson, Consultant, Los Angeles, spoke on "Bacteriology of Water Pipes" (see page 52, this JOURNAL).

D. W. Graham, Chief Chemist, Dept. of Water and Power, Los Angeles, followed with "Trends in American Water Laboratory Practice." His conclusions, based on a questionnaire sent to 46 representative laboratories, were that physical methods are replacing many of the traditional chemical procedures; that the development of new tests, together with the increased knowledge of physiological, biological and industrial relationships, has resulted in analyses being streamlined for specific purposes, permitting more pertinent information with economy of time and material; and that many "standard" procedures are inadequate and in need of revision in the light of recent analytical progress.

Chester A. Smith, Cons. Engr., Burns & McDonnell Eng. Co., Kansas City, Mo., presented a paper entitled "Postwar Planning for Water Supply Utilities."

"Cross-Connection Control and Elimination" by W. E. Shaw, Regional Water Works Advisor, Bureau of San. Eng., State of California, gave the history and emphasized the significance of cross-connection control. He pointed out that numerous hazards have arisen in California because of the rapid expansion of wartime activities.

James H. Howard, Gen. Counsel, Metropolitan Water District of Southern California, Los Angeles, presented "Liability for Water-Borne Disease," in which he explained why governmental immunity from suits based upon negligence of municipally-owned utilities' employees or agents is not held by courts, as supplying water is not held to be a governmental function.

Charles K. Itter, Design Engr. of the Water System of the Los Angeles Dept. of Water and Power, presented a paper entitled "Distribution System Flow Analysis Methods."

"Water Consumption and Unaccounted for Losses" was presented by H. A. Harris Jr., Engr. of Design, California Water Service Co., San Jose, Calif. In the paper, average and maximum daily use for the various communities served by the company is shown and the determination of unaccounted-for losses is detailed.

## Wanted—March 1944 JOURNALS

The Association's stock of JOURNALS for March 1944 is exhausted. If your copy is in good condition and you are willing to part with it, drop a postal card to Association headquarters. Fifty cents will be paid for each copy bought.

**AMERICAN WATER WORKS ASSOCIATION**  
500 Fifth Avenue, New York 18, N. Y.

---

Installation of **BUFFALO Model RA-8** at Centerville-Osterville Fire District, Cape Cod, Mass.

## Make room TO GROW IN

When laying out an installation, it's good practice not only to plan space for stand-by motor generator or pumping sets, but also to let there be room for the added equipment that future growth may demand. Ask any operating man whose motors are crowded in a narrow space between walls.

However, if the stand-by motor is a **BUFFALO**, things are not too bad. Years of designing motors for this service has resulted in their being most conveniently

arranged for inspection and maintenance of wearing parts. Starting can be either manual, remote, or full automatic.

And the big point about Buffalo engines is their unfailing reliability—recognizable from a reading of their specifications and proven by years of service.

Engineers are invited to write for Specification Sheets for their files and to request any information that our experience in varied installations may afford.

*(Continued from page 52)*

**C. F. Zapf**, Supt. of Water Works, Ventura, Calif., has testified to the effectiveness of the electric fish screen which was installed at the intake of the Ventura water system, in a recent announcement by the Electric Fish Screen Co., manufacturers of the equipment. According to Zapf, fish were quite a problem until about three years ago when the electric fish screen was purchased.

"Before we made this installation," said Zapf, "we had to call on the California Fish and Game Commission every so often to seine the fish out of our reservoirs. Since making the installation, we have had no difficulty whatever as far as fish are concerned."

The manufacturers say that the electric fish screen does not impede the normal flow of water and that it repels fish of all sizes at the intake without stunning them, thus eliminating the loss of game fish to sportsmen.

The screen, invented by Henry T. Burkey, utilizes pipe-like electrodes which swing freely in the water channel, creating an electrified zone for a space of some 10 to 15 ft. extending from the surface of the water to the bed of the channel. Instead of using ordinary current that would stun or kill the fish, an electronic device generates electrical current waves which effectively stop all sizes of fish, causing them to swim away from the unpleasant stimulus. Furthermore, the elimination of fish being sucked into the system and dying on mesh-type screens solves a problem of sanitation, the company points out, since dead fish, unless constantly removed, frequently become covered with diatoms and bacteria, thus contaminating the water.

**The Hydraulic Development Corp.**, New York, N.Y., has announced that Ben F. Crabbe, Birmingham, Ala., who recently severed his connection with that company, is again associated with it. He will sell Hydro-Tite and Fibrex in Alabama, Mississippi, Georgia, Tennessee and Florida, the latter state being in addition to his former territory. Paul K. Fleming, Chicago, will handle sales and distribution of the Hydraulic Development products, in Indiana, Illinois, Wisconsin and Michigan, maintaining a warehouse stock in Chicago.

**On Nov. 1, 1944, the Dresser Manufacturing Co.**, Bradford, Pa., became the Dresser Manufacturing Div. of Dresser Industries, Inc. Since 1931 it had been the parent of one, then two and, by 1942, seven companies. In 1944 three more were added, and the central offices for the ten companies were moved to Cleveland. Neil Mallon, formerly President of Dresser Manufacturing Co., is president of Dresser Industries, Inc. Dresser pipe couplings and fittings, repair clamps and sleeves, rolled rings and hydraulic press and upset forgings will continue to be produced at the Bradford plant. H. P. Boncher continues to be Gen. Mgr. of the plant, and his engineering and sales force remains intact.

## NEWS OF THE FIELD

In conformance with the directive issued by the War Committee on Conventions, the St. Louis Convention of the American Water Works Association, scheduled to be held May 7-11, 1945, has been indefinitely postponed.

A conference has been held with the Executive Officer of the War Committee on Conventions, but an understanding concerning Section meetings could not be reached. A communication has been sent to Section officers outlining the nature of the situation and advising what steps can be taken toward planning 1945 Section meetings.

*(Continued from page 1)*

**Lt. Col. Harold B. Gotaas, Sn.C.**, formerly Chief of the San. Eng. Sec. of the Div. of Health and Sanitation in the Office of the Co-ordinator of Inter-American Affairs, Washington, D.C., has been made Chief of the Division. Colonel Gotaas joined the Co-ordinator's Office in June 1942, and since that time has visited every country in the Americas, consulting with leaders of the co-operative health service which is being carried out in eighteen of the republics in a co-ordinated program to safeguard and improve the health of the Western Hemisphere. Much of the work that has been accomplished so far was initiated by Colonel Gotaas's section.

Colonel Gotaas graduated in Civil Engineering from the University of South Dakota in 1928, and the next year received an M.A. in the same field from Iowa State University. After holding several positions in private industry, he became City Engr. of Vermillion, S.D., in 1933. Three years later he received a fellowship from Harvard University, where he took a degree in San. Eng. He thereafter engaged in teaching and consulting. At the time he accepted his commission in the Army he was Professor of San. Eng. at the graduate School of Public Health, University of North Carolina. In 1942, Harvard made him a Doctor of Science.

**Nelson A. Pomfret**, Watershed Supervisor, North Jersey District Water Supply Commission, Wanaque, N.J., died on Dec. 28, 1944, after a six-month illness, at 50 years of age. During World War I, he interrupted his course at Rensselaer Polytechnic Institute to enlist in the Army. Shortly after his return, he joined the engineering staff of the North Jersey District Water Supply Commission, which he served in various engineering capacities until his death. He played a large part in the construction and operation of the Wanaque water supply system.

Mr. Pomfret actively supported the New Jersey Section of the A.W.W.A. for many years and served on various committees.

**Emmons DeBerard**, Lt. (j.g.), USNR, has been assigned to the Public Works Dept. of the Naval Air Station at Glenview, Ill., after having completed his training at the Naval Training School, Princeton, N.J. Lieutenant DeBerard was formerly associated with Greeley & Hansen, Cons. Engrs., Chicago.

(Continued on page 6)

## SAVE FOR VICTORY

**EVERYWHERE** Americans are being asked to "SAVE FOR VICTORY." Water works superintendents, engineers and public officials can do more in this connection by investigating the National Method of water main cleaning. This method restores the carrying capacity of pipe to at least 95 per cent of that of new mains, thereby eliminating the necessity for purchase of new mains. Aside from this the National Method makes possible lower pumping costs, greater delivery, reduced insurance rates and clean water.

*Now is the time to do your part—SAVE FOR VICTORY*

# SIMPLEX

**INCREASE FLOW CAPACITY 40% TO 60%**

## MOL or MOLA METERS

with flow ranges

FROM 20 to 1

TO 28½ to 1

OR TO 40 to 1

Two typical examples of the ease and economy of increasing the maximum capacity of flow lines with the use of Simplex MOL and MOLA wide-range meters are given below:

1. A change in operating heads enabled a large municipal water department to increase the total capacity of one of their pumps from a maximum of 60 million gallons per day to 72 million gallons per day by replacing the existing Simplex MO Meter with a Simplex MOL Meter. No change in the Venturi Tube, Pump Impeller, or motor was required, and operating costs showed a marked decrease.
2. By substituting an MOLA Meter for an MO Meter, increased requirements were met without any change in the Venturi tube, permitting an increase of from 13 million gallons per day to 21 million gallons per day.

Simplex MOL and MOLA meters are designed to function over extremely wide flow ranges—and the accuracy of measurement and totalization is maintained at both maximum and minimum ends of the range.

Look into the advantages and economies of making use of Simplex instruments for performing the extraordinary as well as the conventional metering operation.

Write today; our recommendations are made without obligation.

## Specify ARMCO SPIRAL WELDED When You Modernize

One of the urgent postwar jobs facing American municipalities is the modernization of water supply systems. This is the belief of many water-works superintendents who have seen the effects of population shifts and new industrial requirements.

When you "blueprint" for the future consider the advantages of ARMCO Spiral Welded Pipe. It is amply strong without excess weight.

Its spun enamel lining prevents tuberculation—assures highest possible flow capacity. Strong tight joints are assured with any type coupling or by field welding.

Diameters are 6 to 36 inches; wall thicknesses  $\frac{7}{16}$  to  $\frac{1}{2}$ -inch, lengths up to 50 feet. Specify it for your next job. The American Rolling Mill Co., 3031 Curtis St., Middletown, Ohio.

EXPORT: THE ARMCO INTERNATIONAL CORPORATION

# ARMCO STEEL PIPE

*(Continued from page 12)*

The A. P. Smith Mfg. Co., effective Jan. 1, 1945, will discontinue the manufacture of its Federal water meter line. The company has arranged that an adequate supply of spare parts for all meters now in service shall be maintained for its customers.

The company decided on this course after a prolonged absence from the meter field. Early in 1942 the company's Water Meter Div. undertook certain direct war contracts for the production of power-driven machine-gun components and other war material. The expansion of this work led to the complete cessation of meter manufacture in the spring of 1942 when Meter Limitation Order L-154 was issued.

In June 1944 when L-154 was relaxed to permit again the manufacture of bronze-case meters, the company's commitments on war contracts which were then, and are now, being produced in its meter department precluded the early return to meter manufacture.

The company has, therefore, decided to withdraw from the meter field and concentrate its energies, in the postwar period, on the manufacture of its regular line of Smith products, which includes gate valves, fire hydrants, water works brass goods, tapping machines, inserting machines and specials.

**Roger W. Armstrong**, formerly Deputy Chief Engr., New York Board of Water Supply, has been promoted to the post of Chief Engr. to succeed Charles M. Clark, who retired on January 1.

Armstrong was graduated from Tufts College in 1902 and was assistant to John R. Freeman for a short period after receiving his degree. He entered the employ of the Board in 1906. He was at first a member of the Designing Div., and later worked on experiments on vanned nozzles which were subsequently utilized on the aerators at Kensico and Ashokan reservoirs.

A chlorine-dioxide process for purification of water supplies is now being utilized by Niagara Falls, Lackawanna, North Tonawanda and Tonawanda, N.Y., Lockport, Pa., Bangor, Me., and Greenwood, S.C., according to a recent announcement from the Mathieson Alkali Works, New York, N. Y. According to Mathieson Alkali, the chlorine-dioxide process was developed at Niagara Falls to combat unpalatable water resulting from contamination by industrial wastes and algae. It consists of chlorination to destroy bacteria, followed by treatment with chlorine dioxide to remove tastes and odors.

(Continued from page 18)

The Water Resources Review of the United States and Canada, published by the United States Dept. of the Interior Geological Survey, in collaboration with the Canadian Dept. of Mines and Resources Dominion Water and Power Bureau, has issued a report on the "Water Year 1944," which covers Oct. 1, 1943–Sept. 30, 1944. The general picture concerning water supply is as follows:

Damaging floods and excessive runoff in the agricultural Central West and droughts in the important hydro-power producing areas of the industrial Northeast and Northwest were the dominant abnormalities of the water year. Water conditions with respect to war needs were not so favorable as last year.

Although stream flow in the West was widely and frequently subnormal, especially in the Columbia and Gila River Basins, irrigation supplies were adequate chiefly because of the relatively large carryover of storage from last year. Storage reserves on hand at the close of the year as a safeguard against possible deficiencies next year, although diminished, are not generally less than normal.

The year was the third wettest on record in the north central region from Kansas to Manitoba, and the annual flow of representative streams in Iowa and Nebraska was the greatest on record. The excessive annual volume of runoff was due in major part to the record floods of April, May and June. Runoff has been excessive in this region for the past three years.

## PUMPED BY PEERLESS —daily

**300 GALLONS OF WATER**  
for every person in America

The combined daily capacity of the thousands of Peerless Pumps is in excess of 36,000,000,000 gallons. This, figuratively speaking, is enough water to supply every person in America with 300 gallons per day. The colossal production of water, pumped by Peerless, is distributed among countless fields—wherever a dependable water supply is needed. Engineers and experienced pump users made exhaustive study before selecting these thousands of Peerless Pumps.

*(Continued from page 20)*

The second wet area extended from east Texas to northern Florida. . . .

Streamflow in Canada was generally subnormal. . . .

Runoff during the water year was exceptionally deficient in the Pacific Northwest states and British Columbia. . . .

For the country as a whole stream flow averaged 108 per cent of normal.

. . . Natural ground water levels . . . were generally above normal in the north central and Rocky Mountain states. . . . They were somewhat below normal in the southern and eastern states during most of the year. . . .

Public water supplies for some of the larger cities in Massachusetts, New York, New Jersey, Pennsylvania and Maryland, as indicated by reports of selected reservoirs, average about 95 per cent of last year and 87 per cent of normal. The net decrease in storage during the year is probably due to sub-normal stream flow in this region and to increasing demands for water. Total storage in four reservoirs in Ohio is 72 per cent of last year, an above-normal year. Storage in ten municipal reservoirs of San Diego, Calif., and in the Hetch-Hetchy reservoir of San Francisco is about the same as last year.

The succession of floods in the west central states during April, May and June, following floods of comparable magnitude one year earlier, was not only the major flood event of the year, but perhaps of many years, since the relatively close succession of floods of this magnitude appears extraordinarily unusual. . . .

### Why is Cast Iron Pipe Known as Public Tax Saver No. 1?

**T**HE public has an important stake in the economical operation of water supply, gas distribution and sewerage systems, as reflected in taxes, assessments or rates. By avoided replacements of mains, which would have been necessary with shorter-lived pipe, Cast Iron Pipe has saved the public millions of dollars in taxes. Many years after the bonds issued to pay for them have been retired and forgotten, Cast Iron mains are still in service.

The principal reasons why Cast Iron Pipe has earned its reputation as Public Tax Saver No. 1 are as follows:

*A Century or more of useful life as a structure.* The *proved* useful life of Cast Iron Pipe is at least double the *estimated* life of other pipe materials used for underground mains.

*A Century or more of high capacity as a carrier.* Cast Iron Pipe (except in certain locations) assures 100 years of useful life and 100 years of high carrying capacity. In those locations where tuberculating waters are a problem, lined Cast Iron Pipe insures continued high carrying capacity for the life of the pipe.

*Low Maintenance Cost . . .* far below that of any other pressure pipe material which has been in use long enough for the recording of conclusive data.

Address inquiries to Cast Iron Pipe Research Ass'n., Thos. F. Wolfe, Research Engineer, Peoples Gas Bldg., Chicago 3, Ill.

# THERE'S A HEAP LESS TROUBLE

IN LAYING BELL &  
SPIGOT MAIN with a  
Jointing Compound that

- Can't change its correct chemical composition
- Isn't subject to damage by rain or flood
- Melts quickly and handled easily
- Needs no skilled labor
- Weighs only 1/5th as much as lead and goes three times as far
- Delivers lastingly tight joints with far above the usual resistance to thermal and mechanical shock

WHICH ONE? You guessed it!

*Tegul-*

**AS CITIES  
GROW-**

### **WATER SYSTEMS MUST BE EXPANDED**

The growth of cities and towns will ever continue. For every thousand increase in population, there will be a need for more water.

Water Systems must keep a step ahead of the need. They should be of the finest quality and highest efficiency. Furthermore repair and maintenance service must always be obtainable.

For absolute dependability, you will choose Layne Systems. They have scores of years of proven service with hundreds of municipalities, industries, war camps and ship yards. Their records of long life and low upkeep cost have never been equaled.

Right now Layne is offering the co-operation of their engineers on postwar planning. If you are facing an increased water supply problem, write for details, literature etc.

# THERE'S A STRING OF THEM NOW

## ACROSS THE COUNTRY

**Producing Clear, Soft, Iron-Free  
Water for Many Municipalities**

When it's reconversion time, there will be new materials, methods and ideas to be developed and perfected and molded into useful equipment . . . equipment which eventually will find application in important beneficial public works improvements.

In the Water Conditioning Field, however, there is no need to wait for this "miracle" equipment to materialize because

ACCELATORS had already gone through the developing and trying-out stage before the war. There's a string of municipal Accelator installations across the country now

ACCELATORS are doing a lot of different things for a lot of different kinds of water . . . clarifying . . . softening . . . stabilizing . . . removing color . . . taking out iron.

Results are always excellent . . . frequently remarkable.

You can't beat ACCELATORS for Performance and Economy. Would you like Bulletin 1824?

# GENERAL CHEMICAL "ALUM"

... EQUALLY EFFICIENT FOR COAGULATION  
OF *WATER and SEWAGE!*

Today, aluminum sulfate is almost universally accepted by water experts as the best coagulant for the removal of turbidity, color and bacteria from water . . . and General Chemical Aluminum Sulfate is the outstanding choice the nation over. The reason? Operating men have come to rely on its high quality and constant uniformity, knowing that the effectiveness of General Chemical Alum has been "proved in the settling basins" year after year in

towns and cities all over America.

Municipal officials in charge of sewage disposal find that clarity and purity of sewage effluent are also easily obtainable with General Chemical Aluminum Sulfate because of the many reasons noted below. Why not join the majority of American cities that prefer General Chemical Alum—and specify "General" for *your* water works and sewage disposal systems? Ask any Technical Service Office for details.

## ★ FOR WATER WORKS

1. Produces crystal-clear water.
2. Gives better floc formation resulting in longer filter runs.
3. It is a low-cost coagulant.
4. Has no chlorine demand, conserving chlorine exclusively for disinfection.
5. Superior in tests against other coagulants.
6. High in quality, its constant uniformity can be counted upon.
7. Aids in the reduction of tastes and odors.

## ★ FOR SEWAGE PLANTS

1. Clean, easy to handle, dry feeds well, and economical to use.
2. Simple application, requires only low cost feeding apparatus and minimum attention.
3. Clear, colorless effluents are possible.
4. Sludge digests readily.
5. Treated digested sludge dries quickly, with a minimum of odor.
6. Chlorine consumption is cut due to lower demand of clarified sewage.

### NEW LaMOTTE H-C CHLORINE COMPARATOR

(For High Chlorine Concentrations—  
1.0 to 200 ppm. and above)

A special Chlorine Unit designed for uses where a high residual of 1.0 ppm. or more of chlorine is maintained. Price, complete with instructions, \$12.50.

The H-C Chlorine Comparator is one of a complete new line of LaMotte Chlorine Units. Embodies latest approved developments such as control of color development, pH, etc., along with a new series of interchangeable 15 mm. chlorine color standards embracing the entire useful range. The new LaMotte o-Tolidine reagent is used with all LaMotte units, and may be purchased separately, in various package sizes. Write for descriptive booklet.

**American Water Works Assn.  
500 Fifth Avenue, New York 18, N.Y.**

*(Continued from page 22)*

Significant floods, occurring in seven months of the water year, were reported in 25 states and one province. . . .

Major areas of deficient water supplies included Quebec, the Maritime Provinces, parts of New York, the Ohio Valley, the Pacific Northwest, British Columbia, and Southern Arizona.

There were significant areas of deficient stream flow in every month of the year. In some places these months of deficient flow followed (as in Tennessee) or were followed (as in Virginia and Mississippi) by above-normal or even excessive flow, so that the net runoff of the year in these places was normal or near normal. . . .

Water conditions were most critical in Maryland and New Jersey during July and in coastal Virginia during July and August. . . .

In the Ohio basin, the drought reached its culmination during July, but storage reserves were ample so no power shortages occurred and, except locally, there were only a few deficiencies in municipal supplies. . . .

The total pumpage of ground water in the United States during the 1944 water-year undoubtedly exceeded that during 1943, which was the greatest on record at that time. The withdrawal of ground water by Army and Navy establishments, by industrial plants and by public water-supply systems remained at high rates or increased in many centers of population.

**The Whitmarsh Research Laboratories** were dedicated by the Pennsylvania Salt Manufacturing Co. at Whitmarsh, Pa., on October 4 with a luncheon and speeches by officers of the company and by C. F. Kettering, Gen. Mgr., General Motors Corp., Research Div.

Thus the research laboratories of Penn Salt are now housed in the converted home of the late Edward T. Stotesbury. The 2½-million-dollar mansion is of fireproof, reinforced concrete and steel construction, faced with limestone, and has a copper roof and tile terraces. The mansion was already provided with outside utility services, its own steam generator and power plant, ice machinery and ice plant, artesian wells and water storage tanks, a separate sewage disposal system, 65 telephone stations, and passenger and freight elevators. To provide for an integrated program of

## FILTER FLOORS WATERPROOFED WITH BITUMASTIC 3-C

At the Bureau of Water of the City of Philadelphia leaks in the concrete floors of 22 slow sand filters, providing 90,000,000 gallons of filtered water per day, were making it impossible to control the filtration rate.

A special coating of Bitumastic 3-C applied hot in four coats alternated with Bitumastic saturated cotton fabric, completely waterproofed the 15 acres of filter floors.

When inspected five years later the coating was found to be in perfect condition.

*A copy of the booklet, "Bitumastic Protection for Water and Sewer Pipe Lines," will be sent on request.*

work, including offices, library and Patent Division quarters as well as research laboratories, shops, pilot plant facilities, greenhouse and experimental farm, and special electrical and mechanical services, Penn Salt augmented the existing facilities with additional electrical capacity, high pressure steam and a separate system for disposal of laboratory wastes. Architecturally the rooms and the building are practically untouched, and the gardens, which gave the estate a reputation as "The Versailles of America," are being preserved intact.

Two reinforced concrete basements made Whitmarsh Hall the repository of the Metropolitan Museum of Art's treasures for two years during which it was deemed that there was some danger of a German bombing attack on New York.

The Pennsylvania Salt Manufacturing Co. makes chemicals used in water purification and sewage treatment, ammonia and other refrigerants.

The National Board of Fire Underwriters has issued new Standards for the Installation and Operation of Centrifugal Fire Pumps. It is Pamphlet 20, and supersedes the edition of 1939 as amended by the Supplement of October 1943.

## M-SCOPE—BURIED PIPE AND CABLE FINDER

*Exclusively manufactured by the Fisher Research Laboratory*

The M-SCOPE quickly locates the exact position of underground pipe-lines, bends, dead-ends, valves, cast iron bells, stubs, marble obstructions, etc. It determines depth of a pipe-line or metallic conductor. Traces exact course of underground line. It eliminates needless digging and tearing up—saves labor, materials and time.

Write to the Fisher Research Laboratory for latest 16-page booklet explaining the above method.

Please place your order *now* for immediate delivery from our Palo Alto, Calif., or Chicago, Ill., warehouses.

## NEWS OF THE FIELD

Membership growth of the American Water Works Association continues at a rate which should be the cause for pride on the part of every old-timer.

During 1944 a net gain of 515 brought the total membership of all grades up to 5,485. Only one year in Association history brought more new members—that was 1943. From the low point of 2,221 at the end of 1933, A.W.W.A. has more than doubled its membership.

What place in the industry do the members occupy? This can be answered by the following analysis of 1944 membership:

Superintendents, Managers, Public Relations Directors .....	39.1%
Engineering and Construction Departments .....	5.5
Pumping Departments .....	0.8
Distribution, Service, Meter Departments .....	1.3
Accounting, Commercial Departments .....	0.7
Water Treatment Superintendents, Technicians .....	6.3
Unclassified Water Works Employees .....	0.6
Mayors, City Managers, City Clerks .....	1.0
City Engineers, Water Commissioners, Officials .....	2.7
Consulting Engineers, Consulting Chemists .....	8.2
Sanitary Engineers (Industrial or Governmental Unit) .....	6.7

More than 50 per cent of the membership is at the executive level—either managers or superintendents, mayors or city managers, consulting engineers or consulting chemists. In other words, the A.W.W.A. is dominated by those who function at the executive or policy-making level in public water supply operations.

This brings responsibilities to the Association which could be overlooked. That the officers and directors of the A.W.W.A. recognize their responsibilities to the public and to the personnel of water works systems is evidenced by the many instances where the position of the A.W.W.A. on important problems is definitely expressed, by the participation of officially designated representatives in activities of national importance and, most recently, by the adoption by the Board of *The Members Code of Practice*. This brief document has been received with great interest by the field and approval of it has been recorded by many members.

The A.W.W.A. is growing—and growing up.

(Continued from page 1)

**Denis F. O'Brien**, Chairman of the Board of the A. P. Smith Manufacturing Co., East Orange, N.J., died suddenly on January 31.

Mr. O'Brien was born in Killorglin, County Kerry, Ireland, on Oct. 11, 1864, and was educated at Dublin University. He was active in the affairs of the Irish political party associated with Parnell, and on the night in 1882 that Parnell was arrested and taken to England, Denis O'Brien started for America. Those who knew the cultivated and suave gentleman of mature years would never, unless the story were told of him, suspect that he had once been an active political non-conformist.

Mr. O'Brien first went to Detroit, where he had relatives. He soon became general manager of the Galving Brass and Iron Works, western representatives of Anthony P. Smith, water works engineer then in charge of Newark Aqueduct. In 1896, Mr. O'Brien came east and with Mr. Smith formed the A. P. Smith Manufacturing Co. in Newark. Mr. O'Brien was treasurer of the company until Mr. Smith's death in 1910, when he became president and general manager.

Mr. O'Brien patented and developed many types of valves, valve inserting machines, lead furnaces and hydrants, including the "O'Brien Hydrant," which is standard in New York, Philadelphia, Baltimore, St. Louis, and many other cities throughout the country.

Mr. O'Brien was an Honorary Member of the A.W.W.A. and served four terms as a Manufacturer's Representative on the Board of Directors. He was one of the prime movers in the organization of the Water and Sewage Works Manufacturers Association and was its first president in 1909. He filled the same office again in 1926 and in 1942.

His son, Hubert F. O'Brien, succeeded him as president of the A. P. Smith Manufacturing Co. several years ago.

# THERE'S A STRING OF THEM NOW

## ACROSS THE COUNTRY

**Producing Clear, Soft, Iron-Free  
Water for Many Municipalities**

When it's reconversion time, there will be new materials, methods and ideas to be developed and perfected and molded into useful equipment . . . equipment which eventually will find application in important beneficial public works improvements.

In the Water Conditioning Field, however, there is no need to wait for this "miracle" equipment to materialize because

ACCELATORS had already gone through the developing and trying-out stage before the war. There's a string of municipal Accelator installations across the country now

ACCELATORS are doing a lot of different things for a lot of different kinds of water . . . clarifying . . . softening . . . stabilizing . . . removing color . . . taking out iron.

Results are always excellent . . . frequently remarkable.

You can't beat ACCELATORS for Performance and Economy. Would you like Bulletin 1824?

# INFILCO

INCORPORATED

325 W. 25th PLACE, CHICAGO 16, ILL.

(Continued from page 2)

The A.P.O. recently delivered to Association headquarters the following bits:

Past-Pres. Jack J. Hinman Jr., Lt. Col., C.E., writes from the Pacific Theatre that he is "surprised and pleased to learn that I now 'join the ranks of the elder and honored "statesmen" of the Association' on completion of thirty years of continuous membership." Colonel Hinman has sent for a number of back issues of the JOURNAL, which he is sure "will be helpful . . . and of course will be interesting."

"I am hoping," he continues, "to do quite a bit of professional work in the course of my activities. I have done some already. But of course I cannot tell any details at the present time."

T/4 Charles V. Costello, former Chief Filter Operator, Binghamton, N.Y., inquires from "Somewhere in Holland": "If you have any information on the new use of CO<sub>2</sub>, chlorine and sodium chlorite for sterilizing water, I would very much like to receive it." Sgt. Costello will be kept abreast of latest water works developments, it is hoped to the advantage of the Army and the Hollanders.

(Continued on page 6)

## STANDARDIZE?

### *By All Means!*

No experienced waterworks executive would consider changing makes if *thoroughly* satisfied. Nor would any sensible manufacturer suggest doing so.

But many cities call for bids on all requirements and buy on price alone (there is seldom very much difference in price among standard Valves and Hydrants). This results in a hodge-podge of various makes which will be a *continual nuisance* to the waterworks executive—and more expensive to the city, in the long run.

So if you are 100% satisfied with the make representing a majority, by all means **STANDARDIZE**—and earn the blessings of future generations (good equipment will still faithfully be serving your great, great, grandchildren).

**RENSSELAER VALVE CO., TROY, N. Y.**

# 15,000 MILES *of* HILL-HUBBELL PRECISION APPLIED STEEL PIPE PROTECTION

(Continued from page 4)

**William J. Lyman**, Southern Sales Manager of the National Cast Iron Pipe Co., died in Owensboro, Ky., on January 15, while on a business trip.

Mr. Lyman was born in Knoxville, Tenn., and was educated at the University of Tennessee. He joined the staff of the National Cast Iron Pipe Co., a division of James B. Clow & Sons, in 1929, and maintained his headquarters in Birmingham, Ala. He had been an Active Member of the A.W.W.A. since 1936.

Mr. Lyman was a brother-in-law of Wellington Donaldson, Chief of the Bureau of Sewage Disposal Design, New York City.

**M. F. Hoffman**, former Commercial Supt., Cincinnati Dept. of Water Works, has completed a contract with the city of Cleveland, which engaged him to co-ordinate and reorganize the commercial, collection and accounting functions of the Dept. of Public Utilities, comprising the Divs. of Water & Heat, Light & Power and Sewage Disposal. He was associated with Burns & McDonnell Eng. Co. of Kansas City for the survey, and as a result of his report the Consolidated Commercial Div. has been streamlined and mechanized to improve public relations and effect economies of more than \$400,000 a year.

Hoffman has had 35 years' experience in public utility and government research and administration. Included are seventeen years as Revenue Supervisor, Cincinnati and Suburban Bell Telephone Co., three years as Research and Methods Asst., Cincinnati Bureau of Governmental Research, and fifteen years as Commercial Supt., Cincinnati Water Dept. He won the Fuller Award for the Ohio Section in 1941 for his "outstanding activities in the development of the Ohio Section and the conduct of its affairs."

Hoffman is now residing in Cleveland, where he is engaged in further consultation practice.

(Continued from page 6)

**Seth M. Van Loan**, Chief Engineer of the Philadelphia Water Rehabilitation program, and formerly Chief of the city's water bureau, died on February 8.

Mr. Van Loan was born in Athens, N.Y., in 1873, and first engaged in engineering work on the Erie and State Barge Canal survey in the 1890's. He went to Philadelphia in 1901 as an Assistant Engineer in the Municipal Water Filtration Plant. The program which he presently headed is an \$18,000,000 project.

Mr. Van Loan, who joined the A.W.W.A. in May 1914, was a trustee for the 1928-30 term, and a Director from 1933 to 1936. In 1943, the Four States Section named him for the Fuller Award for his "long and valuable services to the water works field, the City of Philadelphia, the Four States Section and the A.W.W.A."

**Capt. Joseph M. Sanchis, Sn.C.**, has succeeded Major A. M. Buswell as Chief of the Water Chemistry Section of the Medical Research Laboratory at Edgewood Arsenal, Md. Captain Sanchis was formerly with the Div. of San. Eng., Dept. of Water and Power, Los Angeles.

**W. Douglas Smith** is now located in Greenville, S.C., where he is representing Eshelman & Potter, Charlotte, N.C., Southern Representatives for Hagan Corp., Hall Laboratories and Calgon, Inc. Smith recently retired to inactive duty after serving 27 months as Post Chemical Warfare Officer, Camp Blanding, Fla., with the rank of major. Smith holds a B.S. degree in chemistry from Furman University and an M.S. in Chemistry from Tulane University. He was chemist for the Pacific Mills, Lyman, S.C., until 1934, when he became dyestuff salesman for Geigy Co., Inc. In 1940 he joined the Charlotte office of Eshelman & Potter.

## Peerless Pumps

*...bring deserts to life...supply water for entire cities*

The irrigation pump pours out torrents of cool, clear water from deep underground, and arid wasteland turns green and bears fruit. In great cities and humming factories, batteries of pumps supply hundreds of thousands of gallons of life-giving water every minute. *Wherever water is pumped—*cities, factories, ranches, overseas with our armed forces—Peerless Pumps are known

and preferred. Whatever its type—Turbine, Hi-Lift or Hydro-Foil—every Peerless Pump embodies the superb engineering, advanced design and sound construction that is typical of *all* products made by FMC.

The famed "Water Buffalo" amphibious tanks were designed (in cooperation with the Bureau of Ships, U.S. Navy), engineered and are manufactured by FMC.

*(Continued from page 8)*

**The Journal of the British Waterworks Association** for December 1944 tossed orchids across the Big Pond in the following form:

The cover of the September number of the JOURNAL of the American Water Works Association—our progressive "opposite number" in the U.S.A.—bore as its sole illustration a reproduction of the B.W.A. water economy poster, "The Fireman." "We pay tribute," says editorial comment, "to our British contemporaries for their fine Public Relations programme which has done so much to make the people active partners in an economy and safety campaign of national importance."

The Public Relations Committee have been much encouraged by this generous tribute. Incidentally, Mr. H. Berry, M.I.Mech.E., A.I.Struct.E., F.R.S.A., Chairman of the Metropolitan Water Board and Chairman of the B.W.A. Public Relations Committee, has been elected an Active Member of the American Water Works Association.

**Capt. C. W. Brinck, S.C.**, has been assigned to Military Government and, after a session at the University of Virginia, is now receiving training at Yale University. When he first enlisted he served at Carlisle Barracks, Pa., and Edgewood Arsenal, Md., and then was Medical Inspector at Keesler Field, Miss., for fifteen months.

Captain Brinck graduated from Montana State College in 1935 with a B.S. degree in Chem. Eng. and received an M.S. in San. Eng. from Harvard University in 1940. He was Asst. Director of the Water and Sewage Div., Montana State Board of Health, from 1936 to 1942.

**Samuel I. Zack**, formerly San. Engr. associated with Stone & Webster Eng. Corp., Newton Highlands, Mass., is now San. Engr. with Gannett Fleming Corddry & Carpenter, Inc., Harrisburg, Pa., where he is in charge of engineering and design of water, sewage and industrial wastes treatment plants. Zack, an alumnus of Massachusetts Institute of Technology, was for ten years with the San. Dist. of Chicago, assigned to design, investigations, operation, experimental and large scale treatment plants, and stream pollution and industrial wastes problems. For the next eight years he was associated with the Filtration Equipment Corp. on engineering and sales of water and sewage equipment.

**Francis M. Middleton**, P.A. Sanitarian (R) in the U.S. Public Health Service, has been transferred from the mobile laboratory operations of the Water and Sanitation Investigations Station of the U.S.P.H.S. in Cincinnati to the office of U.S.P.H.S. District No. 4 in New Orleans. His new duties include water, sewage and food sanitation projects in the District. Middleton, who makes his home in Wilmington, Ohio, has been with the U.S.P.H.S. for six years.

**First Lt. Richard E. Roby**, Sn.C., is now posted in Iran, where he is in charge of a Malaria Control Unit. While on duty in this country, Lieutenant Roby was stationed at Texarkana Ordnance Center, and at Camp Barkeley, Tex. As sanitation officer or medical inspector of these installations, his work consisted of checking conditions affecting the health of the troops. In addition, he served as sanitary engineer for nearby camps which were without such services.

Lieutenant Roby writes from Iran that, "The problems connected with the type of work I am doing are many and interesting, but I'm anxious to have a hand in some of the water work over here, and soon, I hope, to get back to the Hackensack Water Co. and home."

**Harold S. Hutton**, Sales Mgr., Wallace & Tiernan Co., Inc., Newark, N.J., was honored by his associates at a dinner on February 8, on completion of twenty-five years with the company. He has been an Active Member of the A.W.W.A. for the same period.

Hutton, who graduated from Columbia University in 1916 with the degree of Civil Engineer, was an officer in the U.S. Public Health Service and served as a First Lieutenant in the Engineer Corps in World War I. He joined Wallace & Tiernan in 1920, and was subsequently appointed Dist. and Div. Mgr. with headquarters in Pittsburgh, where he was located for a number of years prior to coming to Newark upon his appointment as Sales Mgr.

*(Continued on page 20)*

***Often Clean Sand Will Protect Pipe from Corrosive Attack in Active Soils. In extreme cases use***

### **ARMORED MONO-CAST PIPE**

Ordinarily a bed of clean sand 3 to 6 inches deep on which the pipe is laid and a clean sand covering of equal depth will protect pipe against the corrosive attack of active soils. Some areas, however, such as swamps, muck, brackish or salt marshes and severe alkali soils are so vicious in their corrosive attack that even corrosion-resisting Mono-Cast Centrifugal Pipe should be armored to assure permanence. Armored Mono-Cast Pipe will give lasting service in such severe and corrosive areas where the sand or other treatment may not be effective. Further information gladly supplied on request.

**AMERICAN CAST IRON PIPE COMPANY, Birmingham 2, Alabama**

# LANDMARKS

Here a Ludlow List 75 Ludlow Slide Gate Hydrant, installed many years ago, still serves dependably, its good design truly at home amid the modern stores and apartments of suburban Boston.

This Ludlow List 90 Slide Gate Hydrant is of recent design, and is set farther back from the curb, in accordance with modern practice. This current model offers many desirable features worth investigating.

## IN HISTORIC BROOKLINE, MASSACHUSETTS LUDLOW HYDRANTS TAKE THEIR TRADITIONAL PLACE IN THE AMERICAN SCENE

YEAR in and year out, Ludlow Hydrants serve on, although installation practice may change, and architectural treatments may vary. The List 90 Slide Gate model is now a general favorite the country over. It insures quick water, proper shut-off without water hammer, correct drainage and easy inspection and servicing. Full information, specifications and costs await your request.

## SAVE FOR VICTORY

**E**VERYWHERE Americans are being asked to "SAVE FOR VICTORY." Water works superintendents, engineers and public officials can do more in this connection by investigating the National Method of water main cleaning. This method restores the carrying capacity of pipe to at least 95 per cent of that of new mains, thereby eliminating the necessity for purchase of new mains. Aside from this the National Method makes possible lower pumping costs, greater delivery, reduced insurance rates and clean water.

## CAST IRON PIPE AND FITTINGS

CAN BE FURNISHED TO MEET THE REQUIREMENTS OF ALL EXISTING SPECIFICATIONS

### SUPER-deLAVAUD CENTRIFUGALLY CAST

The standard water bell is the most common type of cast iron pipe joint—popularly known as the "bell and spigot" joint. Available in sizes 3 to 24 inches inclusive, in 12 and 18-foot lengths, and for working pressures up to 250 pounds.

A time-saving, easily installed mechanical joint cast iron pipe now used extensively. Made in all sizes from 3 inches through 24 inches, in 18-foot lengths, and for pressures up to 250 pounds.

Cast iron flanged pipe is widely used for exposed pipe line work, inside and outside of buildings, for conducting water, steam, gas, oil and other fluids. Comes in same sizes and for same pressures as listed above, and in 12 and 18-foot lengths.

Standard Water Bell

"C-N" Mechanical Joint

Flanged Joint

## DRY CHEMICAL FEEDING

### "Vibra-Flow" VOLUMETRIC FEEDER MACHINES

Control the volume flow of dry chemicals and other bulk materials. Rheostat control of rate of feed. Vibrated, non-arching hopper. Can also be automatically controlled by pH indicators, venturi meters, etc.

### "Weigh-Flow" GRAVIMETRIC FEEDER MACHINES

Provide a positive accurate and automatic "Weigh-Flow" of chemical. Eliminate all guess work—and feed exactly the right amount—by weight. Predetermined setting of scale automatically maintains desired weighed flow of material per unit of time.

INVESTIGATE THE  
ADVANTAGES OF

HERE'S HOW KEASBEY & MATTISON IS MAKING IT  
SERVE IN THE WATER WORKS FIELD

## INVESTIGATE

*"Century"* advantages

## BEFORE

installing your pipe line

Your pipe line will be *right* . . . when you install K&M "Century" Asbestos-cement Pipe.

"Century's" light weight means easier handling, smaller installation crews. Its flexible joints permit faster coupling, and wide-radius curves without elbows or bends. It means a saving of time and money . . . and that isn't all!

"Century" Asbestos-cement Pipe is corrosion-free—unaffected by electrolysis—immune to costly tuberculation from within. There's no pressure loss, no flow hamper, no quick replacements or expensive upkeep. In a word, "Century" Asbestos-cement Pipe LASTS LONGER.

Give your community the lasting, inexpensive service of K&M "Century." This sturdy line of pipe is a lasting source of good will and satisfaction.

Thanks to increased facilities,  
"Century" Pipe is available NOW  
for approved municipal work.  
Inquire today.

## TWO TANKS ARE BETTER THAN ONE!

When the California Water Service made plans for improving distribution pressures in their system serving Stockton, Calif., they found that two elevated tanks, one in the eastern section and one in the southern section of the city, would be better than a single installation at a central location. The structures are identical twins—ellipsoidal-bottom tanks with ellipsoidal roofs, 500,000 gals. capacity, 60 ft. 7 in. to bottom.

**AS CITIES  
GROW-**

### **WATER SYSTEMS MUST BE EXPANDED**

The growth of cities and towns will ever continue. For every thousand increase in population, there will be a need for more water.

Water Systems must keep a step ahead of the need. They should be of the finest quality and highest efficiency. Furthermore repair and maintenance service must always be obtainable.

For absolute dependability, you will choose Layne Systems. They have scores of years of proven service with hundreds of municipalities, industries, war camps and ship yards. Their records of long life and low upkeep cost have never been equaled.

Right now Layne is offering the co-operation of their engineers on postwar planning. If you are facing an increased water supply problem, write for details, literature etc.

# GENERAL CHEMICAL "ALUM"

... EQUALLY EFFICIENT FOR COAGULATION  
OF *WATER and SEWAGE!*

Today, aluminum sulfate is almost universally accepted by water experts as the best coagulant for the removal of turbidity, color and bacteria from water . . . and General Chemical Aluminum Sulfate is the outstanding choice the nation over. The reason? Operating men have come to rely on its high quality and constant uniformity, knowing that the effectiveness of General Chemical Alum has been "proved in the settling basins" year after year in

towns and cities all over America.

Municipal officials in charge of sewage disposal find that clarity and purity of sewage effluent are also easily obtainable with General Chemical Aluminum Sulfate because of the many reasons noted below. Why not join the majority of American cities that prefer General Chemical Alum—and specify "General" for *your* water works and sewage disposal systems? Ask any Technical Service Office for details.

## ★ FOR WATER WORKS

1. Produces crystal-clear water.
2. Gives better floc formation resulting in longer filter runs.
3. It is a low-cost coagulant.
4. Has no chlorine demand, conserving chlorine exclusively for disinfection.
5. Superior in tests against other coagulants.
6. High in quality, its constant uniformity can be counted upon.
7. Aids in the reduction of tastes and odors.

## ★ FOR SEWAGE PLANTS

1. Clean, easy to handle, dry feeds well, and economical to use.
2. Simple application, requires only low cost feeding apparatus and minimum attention.
3. Clear, colorless effluents are possible.
4. Sludge digests readily.
5. Treated digested sludge dries quickly, with a minimum of odor.
6. Chlorine consumption is cut due to lower demand of clarified sewage.

# HYDRO-TITE

## AND DRY BRAIDED FIBREX

**A DEPENDABLE SELF-CAULKING JOINT COMPOUND FOR CAST IRON BELL AND SPIGOT WATER MAINS**

**HYDRO-TITE** is a self-caulking sulphur base jointing compound used to joint bell and spigot cast iron water mains and soil pipe. It comes in powder form which insures uniformity and quick melting.

When poured into a joint, **HYDRO-TITE** immediately solidifies upon contact with the metal and bonds to both the surfaces of the bell and the spigot for the entire depth of the joint. It requires no caulking and after pouring a joint, water pressure may be immediately applied.

**HYDRO-TITE** is easy to use, no skill being required to make joints that are tight from the start. Joints made with **HYDRO-TITE** will stand any pressure the pipe will stand.

### DRY BRAIDED FIBREX

**USED LIKE BRAIDED JUTE WILL NOT BREED BACTERIA**

A **SANITARY** Packing used in jointing bell and spigot pipe for water, sewer mains and soil pipe.

**FIBREX** was designed for use with Hydro-Tite and other self-caulking compounds, but is entirely suitable also for joints made with lead, and for Sani-Tite and other asphalt sewer joint compounds. Thousands of pounds of Fibrex are already in service on water lines throughout the country.

## PUMPED BY PEERLESS —daily

**300 GALLONS OF WATER  
for every person in America**

The combined daily capacity of the thousands of Peerless Pumps is in excess of 36,000,000,000 gallons. This, figuratively speaking, is enough water to supply every person in America with 300 gallons per day. The colossal production of water, pumped by Peerless, is distributed among countless fields—wherever a dependable water supply is needed. Engineers and experienced pump users made exhaustive study before selecting these thousands of Peerless Pumps.

**IN OPERATION**

**IN REPAIR**

MANPOWER . . . a prime war-time shortage . . . is conserved by SAFETOP. Its maintenance requires only a few minutes once or twice a year for inspection. Its simple long-lasting mechanism practically never requires adjustment. If broken by a colliding vehicle, the repair is a one-man job, requiring less than half an hour. And it conserves the firemen's time, too, because of its immediate response and ease of operation. Send for bulletin describing this LABOR-SAVING fire hydrant in detail.

## HOW FAR GONE IS YOUR WATER TANK!

NO PAINT  
NO CHEMICALS

Corrosion of submerged metal surfaces works fast . . . and eventually destroys the unprotected tank.

With Rustop, the cathodic method of rust control, you can save your tank. Rustop removes old rust . . . stops immediately any further corrosion. Is installed without interruption to service. Costs only a few cents a month to operate. Is a permanent protection, without sandblasting . . . scraping or painting.

Cathodic Protection approved by Associated Factory Mutual Laboratories . . . by War Department (Chief Engineers' Office) . . . by American Water Works Assn.

Every type of socket fitting needed for water works construction and maintenance is included in Grinnell's line.

Special features of Grinnell Socket Fittings:

1. Improved design cuts size and weight and lessens friction losses.
2. All socket and spigot dimensions and wall thicknesses are the same as A.W.W.A. Standard Class "D" Pipe.
3. All fittings suitable for use with Super-deLavaud centrifugally cast Bell and Spigot Pipe.
4. Although listed for only 150 lbs. working pressure, suitable for 173 lbs. water pressure as specified for A.W.W.A. Class "D" Fittings.

Write for Catalog 1,  
"Water Works Specialties".

WHENEVER PIPING IS INVOLVED

(Continued from page 50)

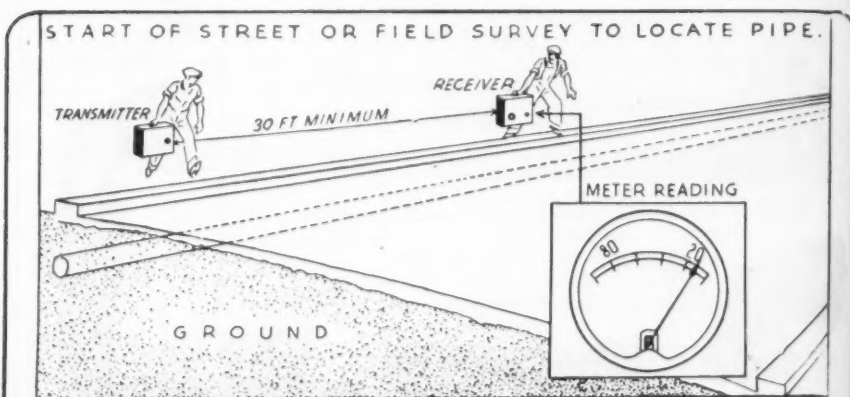

**Springs** command the attention of *Sparling Metrograms* for November 1944. R. W. Sparling, water meter manufacturers who issue it, have found that springs can sometimes be colossal producers of water. Mammoth Spring, Ark., produces 13 mgd. and the 18 acres surrounding it give 864 mgd. The largest such group, however, is the string of springs feeding the Snake River in Idaho, with 5,100 mgd. A group in California, feeding the Fall River, produces 900 mgd.

Some thermal springs are large producers too, *Sparling Metrograms* has found. There are 65 in the U.S. averaging 65 mgd. or more, while there are thousands delivering 0.65 to 6.5 mgd., their water being 65°F. or more. Warm Spring, Mont., discharges 115 mgd.

*Sparling Metrograms* cites as its source the U.S.G.S. Water Supply papers 557, 679 and 774.

The Foxboro Co., Foxboro, Mass., has announced the appointments of Frank Renner to the staff of Sales Engineers covering the southern California territory out of Los Angeles, and Robert Beers to the New-York-New Jersey territory with headquarters in New York.

## M-SCOPE—BURIED PIPE AND CABLE FINDER

Exclusively manufactured by the Fisher Research Laboratory

The M-SCOPE quickly locates the exact position of underground pipe-lines, bends, dead-ends, valves, cast iron bells, stubs, marble obstructions, etc. It determines depth of a pipe-line or metallic conductor. Traces exact course of underground line. It eliminates needless digging and tearing up—saves labor, materials and time.

Write to the Fisher Research Laboratory for latest 16-page booklet explaining the above method.

Please place your order now for immediate delivery from our Palo Alto, Calif., or Chicago, Ill., warehouses.

The Hays Mfg. Co., Erie, Pa., was awarded the Army-Navy "E" on Oct. 24, 1944, for high achievement in making badly-needed materials of war. Col. E. A. Lynn, Dist. Chief, Cleveland Ordnance Dist., A.S.F., said, in making the award, "A long established and highly developed system of unified manufacturing control, together with the fine co-operative spirit of the employees, enabled Hays to convert rapidly from its peacetime manufacturing program. In addition to an excellent war production record, Hays has been able to supply such materials as stops and fittings for water works, gas service and widely varied applications in practically every branch of industry."

The award coincides with Hays' celebration of its seventy-fifth anniversary as a manufacturer of brass, copper, lead and iron water works products.

O. V. Lindell has been transferred from the Kansas City to the Chicago office of the Dorr Co. and appointed Mgr. of the Central Territory. The office in Kansas City will continue to serve the Southwest.

# HARD WATER

vs

# SOFT WATER

**SAVINGS  
UP TO 50%**  
FOR YOUR COMMUNITY  
With "Refinite"  
**SOFT WATER**

Softened water in municipalities is recognized as a money saver. Hard water increases cost in practically every category of water use. Where soap and cleaning compounds alone are concerned, household and industrial users save from 25% to 50% when soft water is used. Hard water precipitates the soap, making necessary the use of more soap, or cleaners, to form efficient suds.

*Illustration above shows the striking difference between hard and soft water. In each bottle there is the same amount of suds . . . but the hard water (in the bottle on the right) requires thirty times as much soap. And notice how murky the water appears . . . this is due to soap curds, the inevitable by-product of hard water and soap. There is nothing in soft water to form curds. The water underneath the suds is as clear as drinking water.*

*At the right is a typical Refinite municipal installation. Municipalities throughout the country have been using Refinite equipment successfully for over a quarter of a century. Let Refinite help you, now, with your water problems.*

OMAHA, NEBR.

(Continued from page 56)

Four chlorinators produced by Wallace & Tiernan Co., Newark, N.J., were included in the first equipment other than weapons in operation on the bullet-swept beaches of Normandy last summer.

Soon after reconnaissance squads of the Engineer Combat Battalion, charged with the mission of purifying water, located a small stream, machinery was in operation. The chlorinators (named Sally, Marian, Kathryn and Sue, after the soldier-operators' wives) pump 15 gal. of unpurified water per minute, adding soda ash, alum, calcium hypochlorite and other chemicals. The water travels through the chlorinators into filters where it passes through fifteen different sizes of sand and gravel. The filter machines set a purified-water production record of 40,000 gpd. The average American soldier consumes at least a one-quart canteen of water each day.

Charles W. Springer, former Sales Mgr., Barrel Div., Jones & Laughlin Steel Co., and a representative of the Chicago Bridge & Iron Co., has been appointed Mgr. of Eastern Sales by the Graver Tank & Mfg. Co., Inc., of East Chicago, Ind. Springer will direct all of Graver's East Coast sales activities from company offices at 424 Madison Ave., New York 17, N.Y.

## NEWS OF THE FIELD

Carl H. Chatters, Executive Secretary of the Municipal Finance Officers Association, Chicago, published the following editorial in the February issue of *Municipal Finance*, under the heading, "Home Rule, States' Rights and Federal Aid":

If home rule for local governments means only the right to get along without revenues and without any kind of help from the state, then home rule is an empty fiction and ought to be replaced by some philosophy of government that concedes that localities have a job to do and are entitled to the money with which to do it. If states' rights and state sovereignty mean that the state will accept no responsibility for its localities but will at the same time make it necessary for them to seek federal financial and administrative assistance, then it is time to stop discussing states' rights and state sovereignty and talk about a relationship which the local governments are actually required to perform. If federal aid is the vehicle for letting the states slide out from under their responsibility and the localities from assuming obligations which they can readily bear, then pious talk about home rule and states' rights should cease and the local governments should admit their only hope lies in looking toward Washington and not toward their state capitals. . . .

There is still a place in the United States for a philosophy of home rule and the practice of state responsibility. Home rule should mean the right of the localities to determine local matters within the scope of general acts passed by the state legislature. The citizens of a locality are also citizens of the state and the state cannot shirk its responsibility for providing adequate local revenues merely by saying that the state needs the money for its own use, or that it has no constitutional power to share with the localities. Constitutions, both federal and state, were made to preserve the rights of individual citizens and they were not intended to be the primary obstacle to the meeting of human needs. Rather, they were intended originally to guarantee freedom and equal opportunity for all citizens. . . .

Let's get straight on this question. The local governments should have the revenues or the authority necessary to finance the activities that are imposed on them. They cannot appropriately ask the state or federal governments to give them money until they have made an honest effort to raise local revenues in a reasonable way and at reasonable rates. Meanwhile the states should grant necessary fiscal authority to the localities; the states should share certain types of revenues; and the states should not take away, by constitution or statute, the means by which local governments can finance desirable and necessary activities. Finally, when the localities have made the best use of their resources and the states have given localities both authority and money, then the federal government may appropriately participate in state and local financing *provided there is a national issue involved* [editor's italics] and the federal acts do not stimulate or require unreasonable local or state expenditures.

Anyway, let us get straight on fundamentals and stay straight.

(Continued on page 2)

(Continued from page 1)

**Harvey S. Howe**, former Deputy Director of the Water Div., Office of War Utilities, WPB, has joined the Lock Joint Pipe Co., Amperre, N.J., as Assistant to the Vice President. Before going to Washington, Howe was Chief Engr., Scranton-Spring Brook Water Service Co., Scranton, Pa.

Walter L. Leach, formerly Chief of the Materials Distribution Section, has succeeded Howe as Deputy Director of the Water Div.

**Charges against J. Grant Frye**, Counselor-at-Law and Attorney for the City of Illmo, Mo., have been dismissed by the judge at Nashville, Tenn., upon the recommendation of the District Attorney General who refused to prosecute the case further. Frye had been indicted by the grand jury in Nashville for extortion and for criminal libel, upon complaint made on behalf of Mr. and Mrs. William A. Riley of the Dixie Tank and Bridge Company. He was tried on the extortion charge and the jury rendered a verdict of guilty. The trial judge set aside the jury's verdict and granted a motion for a new trial. When the question arose of setting the date for the second trial, the District Attorney General advised that he would not pursue the matter further. Later the charge of libel was also dismissed.

Frye will be remembered in water works circles for his article on "Battling the Tank Repair Racket" which appeared in the December 1943 JOURNAL.

**Capt. James K. Latham**, Sn.C., Chief of the Sanitary Branch of the American Armed Forces in the United Kingdom, recently discussed the engineering aspects of "Public Health Administration in the United States," before the Sanitary Inspector's Association, London. Captain Latham in civilian life is a member of the firm of Howard K. Bell, Cons. Engrs., Lexington, Ky., specialists in water and sewage works design.

**Frank E. Willey**, former Supt. of the Lawrence, Kan., Water Dept., has been appointed Production Engr. in the Topeka Water Dept. He succeeds the late Daniel H. Rupp, who was killed by a train on October 23, 1944.

# The **SIMPLEX AIR RELEASE VALVE**

**ELIMINATES SEWAGE PUMP SHUTDOWNS**

**and**

**MAINTAINS PEAK EFFICIENCY**

Formerly, complete shutdown at least once a day—now, easy routine flushing\* once a week! Simplex Air Release Valves at the Pottstown Sewage Works maintain peak operating efficiency of sewage lines and pumps—eliminate frequent and costly shutdowns caused by trapped air and gases from decomposing organic matter.

Simplex Type "B" Valves are especially designed to meet the particular conditions of sewage service. Construction is simple and dependable. There is but one lever movement which operates a needle valve so designed as to be always tight-seating. The valve is operated by a heavy thickness glass ball float, tested to several times the service working pressure. A cast iron shell houses the actuating parts which are of corrosion-resisting materials.

Simplex engineers will gladly assist in the solution of your sewage flow problems. Write today for details.

*\*Routine weekly back-flushing at Pottstown Sewage Disposal Works, Pottstown, Pa., accomplished merely by opening the valve below hose connection shown to allow clear water to fill the release valve and the system. Flush is quickly and easily completed without dismantling any part of the installation.*

## SAVE FOR VICTORY

**E**VERYWHERE Americans are being asked to "SAVE FOR VICTORY." Water works superintendents, engineers and public officials can do more in this connection by investigating the National Method of water main cleaning. This method restores the carrying capacity of pipe to at least 95 per cent of that of new mains, thereby eliminating the necessity for purchase of new mains. Aside from this the National Method makes possible lower pumping costs, greater delivery, reduced insurance rates and clean water.

*Now is the time to do your part—SAVE FOR VICTORY*

**BRANCH OFFICES: NEW YORK—PORTLAND, ORE.—PHILADELPHIA—ATLANTA—DALLAS  
CHICAGO—SAN FRANCISCO—LOS ANGELES**

*(Continued from page 4)*

**On April 1, the Water & Sewage Works Manufacturers Assn.** moved from 12 East 41st St., New York 17, to 170 Broadway, New York 7.

These new quarters are at the address of the first official "Office of the Secretary" of the A.W.W.A. In March 1924, the Association had outgrown the space which Secretary John M. Diven provided at his own residence, and he was authorized by the Board of Directors to rent an office at 170 Broadway, New York City. A.W.W.A. headquarters remained there until April 1928, when they were moved to the Engineering Societies Building, 29 West 39th St. In January 1938, larger quarters were taken in the Johns-Manville Building, 22 East 40th St., and in March 1943, that space was outgrown and a still larger office was leased for five years at 500 Fifth Avenue.

**Edward A. Bell**, former Borough Engr., Essex Falls, N.J., was recently promoted to a full lieutenantancy in the Naval Reserve, and is posted in the Superintending Civ. Engr.'s Office in the Alaska Div. of the Navy Dept., Bureau of Yards and Docks, Seattle.

**Hugh S. Dewey**, A.W.W.A. Director for the New York Section, has been appointed President of the Western New York Water Co., Buffalo, to succeed Charles M. Chenery, of New York City. Dewey had been Vice-President of the company since 1930. A native of Rochester, he was formerly an executive of the Rochester and Lake Ontario Water Service Corp. He is a graduate of the University of Rochester.

The Western New York Water Co. is a subsidiary of the New York Water Service Corp., of which Chenery is President. The latter company is in turn owned by the Federal Water Service Corp., of which Chenery's brother, Christopher T. Chenery, is President.

**Major C. Hagar**, former Supt. of the Boonville, Mo., Water Dept., assumed the duties of the Supt. of the Water Dept. at Lawrence, Kan., on January 1. Hagar left his Boonville post in 1942 to do war work in Pennsylvania. He returned to Missouri in 1944 because of ill health and served with the Malaria Control Unit of the U.S.P.H.S. at Canithersville, Mo., before going to Lawrence.

## ROCKY MOUNT CONTROLS CORROSION BY THRESHOLD TREATMENT WITH CALGON\*

One of the last water-treatment plants to be built before wartime restrictions were imposed serves the city of Rocky Mount, North Carolina.

This plant is the last word in modern equipment and modern methods, so naturally it employs threshold treatment with Calgon to make sure that troubles from corrosion will not arise.

Since the water, which is pumped from the Tar River, is unusually soft with a pH value that stays close to 7.0, the use of 2 ppm. of Calgon controls corrosion, the water retaining its desirable softness and neutral characteristic.

In hundreds of American communities, Calgon is used in water supply systems to prevent scale, inhibit corrosion, stabilize pH values and prevent the precipitation of dissolved iron—all at extremely low cost.

Let us send you full information about it.

The "Ohio Section News" quoted in its February number the following press release, sent by W. H. Stoneman from Aachen to the Chicago Daily News on November 15:

It is the job of the United States Army Air Force and the Royal Air Force, and of our artillerymen, to knock down German towns and to make them unfit for human habitation. It is the job of Major M. W. Tatlock, Dayton, Ohio, to undo their work.

Machine guns were still sputtering in Aachen's outskirts when Major Tatlock drove into the city and began to ransack the rubble in search of enough public utilities to make life livable for the remaining population.

He found the water pumping station intact, together with two good reservoirs. He also found the local electric power station intact. The gas system, alone of the three most vital public utility plants, was ruined. Even the local sewage disposal system will be capable of functioning when the sewers have been put back in order.

The "Ohio Section News" comments that "the Dayton sewage plant blew up a few years ago and Major Tatlock had to dig it out of the wreckage," so blasted works were not new to him.

(Continued on page 10)

## **CYANAMID** *Sulphate of Alumina*

CYANAMID through the control of its basic raw materials can assure you of a uniform high quality product at all times.

It assists in the removal of taste and odor.

It is and remains free flowing.

It is less corrosive than other coagulants.

It does NOT clog the dry feed machine.

It precipitates over a much wider pH range than other coagulants.

Your inquiry is invited on CYANAMID quality Sulphate of Alumina.

Des Moines, Iowa—Two 3,000,000-gallon P-DM Steel Reservoirs

Wau, N. D.—3,000,000-gallon Steel Reservoir

In planning for water storage by reservoir, where supply and topographic conditions are favorable, be sure to combine the natural advantages and economies of this type of storage with the outstanding benefits of *steel* reservoir construction. Pittsburgh-Des Moines Steel Reservoirs are permanently strong and watertight—unaffected by weather or seasonal change—can be erected at any time of year—require only an infrequent coat of paint to retain new appearance, and are lower in first cost than other construction types. With a definite, responsible guarantee of satisfaction, P-DM Steel Reservoirs end your water storage problems upon installation—and keep them solved! Write for descriptive Bulletin 102. Consultations gladly arranged on request.

**Gossip of municipal activities** reported in a recent issue of Public Management tells that:

*Waco, Texas*, is now making sewer service charges on its water bills. Charges range from 30 cents for one or two fixtures in a private home to \$1.00 for one or two fixtures in a commercial location, with sliding scales for additional fixtures and other classes of installations. Sewer services outside the city limits bear a surcharge of 50 per cent. The city may disconnect sewer services for failure to pay in 20 days.

*Youngstown, Ohio*, has inaugurated a 3 per cent tax on net billings for electricity, natural gas, water and local telephone service, which is expected to raise \$300,000 per year to provide for garbage collection and disposal, the purchase of fire fighting apparatus and street department trucks, and a reserve fund for postwar projects. The new tax, modeled on a 5 per cent utility tax in Columbus, Ohio, takes the place of a 50-cents per month garbage collection charge, which yielded approximately \$90,000 per year.

*Auburn, N.Y.*, has decided upon charges for sewer, fire and water services outside of the city. Five-hundred dollars will be charged for each

# HARD WATER *vs* SOFT WATER

## SAVINGS UP TO 50%

FOR YOUR COMMUNITY

With

## “Refinite” SOFT WATER

Softened water in municipalities is recognized as a money saver. Hard water increases cost in practically every category of water use. Where soap and cleaning compounds alone are concerned, household and industrial users save from 25% to 50% when soft water is used. Hard water precipitates the soap, making necessary the use of more soap, or cleaners, to form efficient suds.

*Illustration above shows the striking difference between hard and soft water. In each bottle there is the same amount of suds . . . but the hard water (in the bottle on the right) requires thirty times as much soap. And notice how murky the water appears . . . this is due to soap curds, the inevitable by-product of hard water and soap. There is nothing in soft water to form curds. The water underneath the suds is as clear as drinking water.*

## The Refinite Corporation

108 Refinite Bldg.

Omaha, Nebraska

FOR EXCELLENCE IN PRODUCTION

(Continued from page 10)

sewer installation, plus \$7.50 per year per dwelling for sewage treatment. Fire protection will be given only to those neighboring communities contracting for it with the city. Water will be charged at the increased rate of \$2.30 for the first 1,000 cu.ft. per month on individual meters, and \$1.05 per 1,000 cu.ft. per month on master meters. Ten per cent penalty is made on non-payment within ten days. Thirty-five dollars per year is charged for each hydrant outside the city limits. Removing or installing meters is charged at the rate of \$2.00 per call.

*Coos Bay and North Bend, Ore.*, are undertaking, by a vote of their citizens, to set up a joint ownership and operation of the water utility now serving both towns.

*Bradenton, Fla.*, and *Marquette, Mich.*, now bill for utility services by post card.

*Sweet Home, Ore.*, has raised its water rates to consumers outside the city limits. The charges are now \$.75 per 100 cu.ft., with a minimum of \$6.25 per month.

*Yakima, Wash.*, has a sewage disposal plant operated by its water department, so instead of adopting sewer rentals, the city increased its water rates 20 per cent.

*One-hundred-forty-three municipalities* in Alabama, Georgia, Kentucky, Mississippi, North Carolina and Tennessee use the services of the Central Service Association which prepares bills for electric and water utilities.

**John L. Sybrandt**, Chicago, who recently retired as Sales Repr. of the Ludlow Valve Mfg. Co., after 39 years' affiliation with the company, has been appointed purchasing agent, civilian status, in the headquarters of the 9th Naval District, Chicago. Sybrandt's activities cover the purchase of pumping equipment, air compressors, heat treating furnaces, hydraulic equipment and electrically-operated power units, to fill naval requirements all over the world.

## Prerequisites for Efficient Water Systems

## STOPS AND FITTINGS

**F**OR efficient, uninterrupted water service, all materials, particularly stops and fittings, should be of the first quality. For over seventy-six years Hays has specialized in the production of these materials. Throughout these years quality, insuring dependability, has been the foremost consideration. Annoyance, inconvenience and expense can be avoided by using Hays water works materials, in original installations, as well as in any replacements, since Hays Stops and Fittings are interchangeable with all other makes.

Hays Water Service Brass Goods Catalog shows illustrations and gives full description. Send for your copy.

CURB STOP

CORPORATION STOPS

- All Hays Brass is of 85-5-5-5 Mix.
- Each piece is tested at 200 pounds hydrostatic or more.
- Individually ground plugs are especially lubricated for easy turning.
- Water Works Standard Threading permits use of Hays Stops and Fittings in any standard tapping machine.
- Interchangeable with all other makes.

**Governmental units in the United States** were recently summarized in the following table, quoted from a pamphlet, "The Units of Government in the United States," by William Anderson, revised and published by the Public Administration Service, 1313 East 6th St., Chicago 37, Ill.

*Comparison of the Number of Units of Government  
in the United States in 1930-33 and in 1941*

	1930-33	1941
The nation .....	1	1
The states .....	48	48
Counties (in 46 states) and parishes (in 1 state) .....	3,053	3,050
Incorporated places (cities, villages, etc.) .....	16,366	16,262
Towns (as in New England) and organized townships (in a total of 23 states) .....	20,262	18,998
School districts .....	127,108	118,308
Other units .....	8,580	8,382
<b>TOTAL</b> .....	<b>175,418</b>	<b>165,049</b>

Of the 16,262 incorporated places, 9,721 have a population of less than 1,000 persons. It is notable that of the total of 165,049 governmental units 118,308, or approximately 72 per cent, are school districts.

INCORPORATED

325 W. 25th PLACE, CHICAGO 16, ILL.

(Continued from page 20)

**A critical shortage** in the supply of lumber and pulpwood is again threatening the production of essential war materials in this country. Severe decreases in the output of lumber and pulpwood, due to the lack of manpower, and an increasing need for these products to meet essential military demands are the principal factors affecting the supply of these materials.

To alleviate this situation, Tudor Bowen, Chairman of the Co-ordinating Area Production Urgency Com., has sent a Field Service Bulletin to WPB Regional Directors, Production Urgency Com. Chairmen, and District Managers requesting that they give every possible consideration in granting sufficiently high urgency ratings to insure adequate manpower referrals to production of logs, lumber and pulpwood.

It was pointed out that an increase in the production of lumber and pulpwood throughout the entire nation is essential to the war effort. Lumber is now in such critical short supply that a number of important military programs are seriously affected. Unless action is taken immediately to relieve the manpower and equipment situation, it may be necessary for the military to reschedule some of its essential programs. Over-all lumber production has decreased steadily month by month since August. The supply for the first quarter 1945 is estimated to be 18 per cent below requirements.

Over-all pulpwood inventories in the United States have dropped 12 per cent in the months of September through November of 1944. Much of the available wood pulp supply is now going for non-paper usage such as explosives, rayon and cellophane and the requirements of wood pulp for such materials as military shipping containers and explosives are expanding rapidly.

**Russell B. Keeler** is now associated with the Hydraulics Dept. of the Douglas Aircraft Co., Santa Monica, Calif.

### Why is Cast Iron Pipe Known as Public Tax Saver No. 1?

**T**HE public has an important stake in the economical operation of water supply, gas distribution and sewerage systems, as reflected in taxes, assessments or rates. The principal reasons why Cast Iron Pipe has earned its reputation as Public Tax Saver No. 1 are as follows:

*A Century or more of useful life as a structure.* The *proved* useful life of Cast Iron Pipe is at least double the *estimated* life of other pipe materials used for underground mains.

*A Century or more of high capacity as a carrier.* Cast Iron Pipe (except in certain locations) assures 100 years of useful life and 100 years of high carrying capacity. In those locations where tuberculating waters are a problem, lined Cast Iron Pipe insures continued high carrying capacity for the life of the pipe.

*Low Maintenance Cost . . .* far below that of any other pressure pipe material which has been in use long enough for the recording of conclusive data.

Address inquiries to Cast Iron Pipe Research Ass'n., Thos. F. Wolfe, Research Engineer, Peoples Gas Bldg., Chicago 3, Ill.

**AS CITIES  
GROW-**

### **WATER SYSTEMS MUST BE EXPANDED**

The growth of cities and towns will ever continue. For every thousand increase in population, there will be a need for more water.

Water Systems must keep a step ahead of the need. They should be of the finest quality and highest efficiency. Furthermore repair and maintenance service must always be obtainable.

For absolute dependability, you will choose Layne Systems. They have scores of years of proven service with hundreds of municipalities, industries, war camps and ship yards. Their records of long life and low upkeep cost have never been equaled.

Right now Layne is offering the co-operation of their engineers on postwar planning. If you are facing an increased water supply problem, write for details, literature etc.

## Repair Sleeves

Style 60—for repairing bell and spigot joints: 3" to 60" sizes.

Style 82—adjustable repair sleeve, for CIP distribution lines, from 4.70" to 9.07" OD.

Style 96—to permanently repair defective joints, splits or holes in steel pipe, 12" to 24" OD.

Style 57—for repairing breaks in straight run of cast-iron pipe, 2" to 12" sizes.

We needn't remind you what leaking water lines can do to roadbeds, railroad crossings, bridges and other public construction . . . but we should remind you to place orders for Dresser repair clamps and split repair sleeves as early as possible.

The repair sleeves shown above represent only a small portion of the complete line of Dresser repair products. No matter what type of leak or break occurs in your lines, Dresser has or can make the proper type of repair clamp or sleeve.

When the war is over—or earlier, if permitted—we will again be able to make prompt shipments from complete stocks. Until that time comes, let us know your requirements as far ahead of time as possible. Your orders will be entered on our production schedules immediately.

*Dresser Manufacturing Division, Dresser Industries, Inc., Bradford, Pa.; Houston Office and Warehouse, 1121 Rothwell Street, Sec. 16, Houston, Texas; in Canada: Dresser Mfg. Company, Ltd., 60 Front St., West, Toronto, Ontario.*

CANCER KILLS 1 ADULT OUT OF 6—IT MAY KILL YOU!

**AMERICAN CANCER SOCIETY**  
350 Fifth Avenue, New York 1, N. Y.

Floods and their inevitable aftermath—the menace of epidemic water-borne disease—call for quick and effective action. Countless communities stricken by flood waters know how Mathieson's Sanitation HTH affords prompt chlorination of polluted water supplies—prevents the scourge of disease and makes possible early resumption of safe water service.

Flood threatened communities should maintain adequate stocks of Sanitation HTH to secure the protection its 70% available chlorine provides in meeting flood and other emergency conditions. Check your stock now—and write or wire for additional supply of Sanitation HTH if required.

*Sanitation HTH is available in cases of nine 5-lb. cans and in 100-lb. drums.*

## Coefficient of 155 for BITUMASTIC ENAMEL

*Section of the 39-mile steel pipe line lined with Bitumastic 70-B Enamel laid by the Birmingham Industrial Water Line in Alabama.*

Bitumastic 70-B Enamel spun lining rates a Williams and Hazen coefficient of 155\* for new supply and transmission mains of 20" diameter and larger — a value which insures greater velocity and higher flow capacity.

As a result, a smaller size pipe can be used for the required flow capacity — lowering cost for pipe, excavation, and laying — reducing costs of operation — insuring longer pipe line life.

Bitumastic Enamels can be applied by your own workman under certain conditions or by our contract department.

\*Committee of Pipe Line Coefficients, N.E.W.W.A.

# SPARLING MAIN-LINE METERS

## COMPOUND METERS

**Accurate Over Wide Range of Flows**

**I**N the cut-away view above, the flow is from right to left. Note the valve which begins to open, bypassing the small meter, when the flow reaches the minimum rate of the larger meter.

Registration is accurate over flow ranges as wide as 1 to 125.

There is no sharp cut-over point and the pressure loss, less than 2 pounds per square inch, is the lowest of any compound.

Indicators, Recorders and Controls are optional with all Sparling Meters.

# INSTANTLY RESPONSIVE

...when every  
second counts

Seconds are precious at a fire. Kennedy SAFETOP Fire Hydrants help to save seconds that may mean property and lives.

When a fireman unscrews a SAFETOP nozzle cap, it immediately drops out of the way of the hose. The operating nut opens easily, even after a long period of non-use, because of the simple, straight-line operating mechanism. Water flows from the nozzle at practically full main pressure, because the easy elbow and nozzle curves, extra large valve inlet ports and standpipe, and absence of pockets or obstructions in the hydrant assure minimum pressure loss.

These are some of the reasons why fire chiefs and firemen are so enthusiastic about Kennedy SAFETOPS.

Write for bulletin describing ALL the special SAFETOP features.

TURBINE PUMPS

## Cement-lined MONO-CAST PIPE Prevents Tuberculation

Mono-Cast Cement-lined Pipe installed in the Summerville Test Line is periodically dug up for inspection. Repeated inspections over a period of years fail to reveal the slightest signs of incrustation from this water which is highly tuberculating. The cement lining of the pipe has remained smooth and consequently the value of the coefficient "C" remains practically constant.

Economical and long-lasting, Mono-Cast Pipe may be had with a variety of joints to meet every condition. Write for full details.

Section of typical large-diameter pressure filter utilizing standard and special plain underdrain plates.

## FOR BOTH PRESSURE FILTERS AND WATER SOFTENERS

...The "ALOXITE" porous underdrain system has proved just as practical, efficient and economical as in large gravity units.

Section of typical small-diameter pressure filter utilizing a single plain circular underdrain plate.

In numerous installed units ranging from 1 to 9 feet in diameter, "ALOXITE" ceramically bonded aluminum oxide underdrain plates are giving the following outstanding benefits:

1. **No gravel** to become "upside down" through excessive or non-uniform wash.
2. **Reduced cost** of steel shell and some piping due to decreased height.
3. **Less washing** due to better uniformity.
4. **Reduced pressure** losses during both filtering and back-washing.

These and other benefits of the "ALOXITE" porous underdrain system are fully described in Engineering Bulletin No. 2. Write today for your copy. THE CARBORUNDUM COMPANY, Refractories Division, Dept. V2, Perth Amboy, New Jersey.

**A referendum is not necessary** in order for a community in the state of New York to chlorinate a polluted public water supply, according to a recent issue of *Health News*, weekly news letter of the New York State Dept. of Health. *Health News* relates the following story:

Referendum to the voters of a community is not required in order to provide chlorination of a polluted public water supply, according to a recent opinion rendered by Nathaniel L. Goldstein, Attorney General of New York State.

A question involving this point arose following the defeat, by the electorate of an upstate community, of a proposal to provide funds for chlorination of the municipal water supply which had become polluted, and the subsequent issuance by the State Commissioner of Health of an order directing chlorination on or before a specified date. As a basis for future action in such situations, the Department asked the advice of the Attorney General on the following questions:

- "1. Considering the emergency existing and the fact that the village board has received an order from the State Department of Health, as referred to above, is said village board legally justified in going ahead with the improvement without a new referendum?
- "2. In the case where an order is issued, the referendum is held and defeated by the electors, may the village board, in consideration of the facts stated above and acting under the order, legally proceed to comply with the requirements of said order?"

## Will Your Pipe Lines Deliver Peak Efficiency at Low Cost?

One of the urgent postwar jobs facing American municipalities is the modernization of water supply systems. This is the belief of many waterworks superintendents who have seen the effects of population shifts and new industrial requirements.

When you "blueprint" for the future consider the advantages of ARMCO Spiral Welded Pipe. It is amply strong without excess weight.

Its spun enamel lining prevents tuberculation—assures highest possible flow capacity. Strong tight joints are assured with any type coupling or by field welding.

Diameters are 6 to 36 inches; wall thicknesses  $\frac{3}{16}$  to  $\frac{1}{2}$ -inch, lengths up to 50 feet. Specify it for your next job. The American Rolling Mill Co., 1051 Curtis St., Middletown, Ohio.

## ARMCO STEEL PIPE

(Continued from page 44)

In his reply the Attorney General stated:

"Matters of public health have always been recognized as within the police power of the State, and the police power of the State has never been questioned when it dealt directly with the hygienic conditions of a community (*Adler v. Deegan*, 251 N.Y. 467; *Robertson v. Zimmerman*, 268 N.Y. 52).

"It is my opinion, therefore, that the order of the Commissioner of Health, under the authority of Section 88 of the Public Health Law, is mandatory and that no referendum is required. If one is held, it is merely a futile gesture and the order of the Commissioner, if reasonable, must be complied with.

"My opinion is further strengthened by an examination of Section 225 of the Village Law, the provision most applicable to this question, which reads as follows:

'The Board of Trustees may, by resolution, determine to purchase or acquire additional water or water rights or to construct or add to a water purification or treatment plant or to construct additional reservoirs, or to otherwise increase the system of water for the village. If such resolution is adopted the same shall state the maximum sum to be appropriated for that purpose and such improvements shall be made accordingly. For that purpose the board has the same power and is subject to the same duties and liabilities as in the construction of the original system of water works.'

"My predecessor held (1931 Atty. Gen. 322), in construing this section, that no permissive referendum was required. There has been no change in this section since that time.

"For the foregoing reason, it is my opinion that no referendum is necessary to provide for chlorination of a water system which has become polluted."

## Prevent Rusting

*Rusta Restor* cathodic protection, provides permanent protection against rusting of water tanks, piping and steel structures of all kinds.

Initial cost of a complete equipment is about equal to the cost of a good paint job. . . . Operation costs only about 2 mills (i. e. \$0.002) per year per square foot of surface protected.

If your tanks and steel structures are not now protected by this proven low cost method, they should be. No obligation. Send for fully descriptive literature today.

(Continued from page 46)

**Water departments** might well bear in mind this decision, quoted from the *January Casualty and Surety Journal*, when considering their attention to meter box covers and curb box covers:

A woman went into a drugstore to make a purchase. Upon leaving, she tripped and fell over the edge of a vault cover on the sidewalk in front of the store. The cover was raised about an inch and a half from the sidewalk and there was a space of about an inch between the sidewalk and the elevated cover. She brought suit to recover for her injuries. The lower court dismissed her complaint. The owner of the building contended that he should not be held responsible as the defect claimed was so trivial and slight that it would be unreasonable to charge him with negligence. But the appellate court held that this was a proper question of fact for the jury to decide. The plaintiff was granted a new trial. (*Gibson v. Jaystone Drug Company, Inc.* (New York 1943) 45 N. Y. S. 2d 380.)

**The A. P. Smith Mfg. Co.** has announced the resignation of Thomas L. Halpin as Gen. Sales Mgr. on Jan. 1, 1945. Halpin, who has been with the company for twenty years in a sales capacity and as Gen. Sales Mgr. since Jan. 1, 1942, is resigning because of a progressive eye ailment which has made it impossible for him to continue in this capacity. He will remain in the sales organization of the company, returning to his former sales territory.

Gerald J. Manahan will succeed Halpin as Gen. Sales Mgr. Previous to his affiliation of a number of years' standing with The A. P. Smith Mfg. Co. in the New England territory, Manahan served several years in a municipal water department and was subsequently general manager of a water works equipment and supply company.

Frank F. Wells will succeed Manahan as Sales Engr. for the New England territory. Wells has spent over twenty years as a sales representative in that area. He recently resigned from the Transite Pipe Div., of the Johns-Manville Corp.

The new New England sales office of the company will be located at 54 Elm St., Melrose, Mass., under Wells' direction.

## NEWS OF THE FIELD

**Cross-connections** and the dangers from back-siphonage are the subject of two articles in this issue of the JOURNAL. The special report made to the National Research Council is discussed by M. Warren Cowles, present chairman of the A.W.W.A. Committee on Cross-Connections, who points out that the desire of customers of water utilities to provide water for their own uses without depending exclusively upon the public water supply makes much more difficult than many realize the task of protecting the public against dangers of polluted water. It is too often forgotten that not the water utility but the wilful customer creates the problems derived from uncontrolled private supplies or from inferior plumbing practices.

It is unfortunate that so widely read a periodical as *Newsweek* should in its April 2 (1945) issue discuss the report in these words: "Ever since the Chicago amebic dysentery scare in 1933, public water supply systems have been suspected of contamination." The Chicago amebic dysentery epidemic was a catastrophe—not a "scare." The engineering studies made it clear that back-siphonage on customers' premises, not the public water supply of Chicago, was the cause of the disaster. The National Research Council report shows that the distribution of water on customers' property still continues to menace health, because the customers (some of them agencies of the federal government) have not yet learned that the safe water which is provided by the public utility can be made unsafe through carelessness and bad plumbing.

The *Journal of the American Medical Association* in its March 24 issue comments much more constructively.

Sanitary engineering practice has recognized for many years the hazards attached to the current operation of public water supply systems. . . . The systems operate under varying conditions of starting and stopping and with thousands of exposures through plumbing installations attached for maximum public, private and industrial uses. These innumerable outlets and interconnections are essential not only for potable water use but for many of the sanitary equipments operated in a water carriage system. No matter how well conceived a water supply system may be, physical relation to nonpotable liquids may result from many of the uses in a modern community. Control of these many collateral uses is one of the most difficult functions of public service. Rarely does a comprehensive system prevent or eliminate the many cross- and back-siphonage connections which are in existence or which may be continually made.

The Chicago amebic dysentery epidemic in 1933 dramatized the problems attached to the consistent delivery of safe water. This epidemic emphasized the thinness of the dividing line between safety and danger where water supply is exposed to sewage contamination at the points of consumer use.

(Continued on page 2)

*(Continued from page 1)*

These "hazards at the point of consumer use" were the real problems studied by the NRC Committee. They continue to be among the serious problems of water works administration. They lie within the area under the control of the customer, who often resents attempts on the part of the water utility to protect its other customers from his misdemeanors.

The forthright adoption of a property-wide policy of cross-connection control by the American Water Works and Electric Co. is a timely answer to those who would charge the water supply field with indifference. Paraphrasing the "corrupt but contented" phrase of the muck-raking days, the public attitude concerning the dangers from antique plumbing can well be expressed by "in danger but indifferent."

**Louis F. Warrick**, State San. Engr., Wisconsin State Board of Health, has announced the receipt of the following resolution from the Wisconsin State Dental Society, drawn up at their annual convention in Milwaukee in March:

"WHEREAS we, the members of the Wisconsin State Dental Society's Fluorine Committee, convinced that the overwhelming weight of the evidence now precludes any doubt that a drinking water supply containing a concentration of one part per million of fluorine, as fluorides, inhibits dental decay;

"AND WHEREAS all evidence shows that the optimum of one part per million of fluorine, as fluorides, in water has produced no untoward results,

"WE THEREFORE recommend that public water supplies deficient in fluorides have their concentration raised to one part per million of fluorine, as fluorides, to inhibit dental decay, providing that such addition is under dental, medical, engineering and public health control."

Warrick comments that "there has been considerable interest in this subject in recent months, with a very active committee of the Dental Society . . . pushing studies in areas where the amount of fluorine naturally present in the water is around 1 ppm. They have been quite impressed with their observations of children and a review of records of dentists and expect to push forward with these studies, possibly with several communities undertaking the treatment of their water supplies with sodium fluoride.

"Our water works group for the time being has been following the 'role of watchful waiting,' maintaining the position that the Dental Society should make up its mind on the matter, and it is probable, in view of the resolution acted upon, that there will be a detailed discussion of this matter at the next meeting of the Wisconsin Section, A.W.W.A."

Mass treatment of a public health problem is a comparatively new pattern, and the addition of fluoride to public water supply to prevent dental caries has been greatly stimulated by the leadership of Dr. H. Trendley Dean, U.S. Public Health Service [see Jour. A.W.W.A., 35: 1161 et seq. (1943)]. Two Hudson River communities are being used

...OVER CITY STREETS

...MEAN STRESSES HERE

## DRESSER COUPLINGS

absorb harmful vibration ... STAY TIGHT!

One of the common causes of leaks in pipes and joints under city streets is vibration set up by heavy and frequent traffic. Such pipe lines are seldom free from the pounding of heavy vehicles. Dresser Couplings, with their resilient gasket seal, "give and take" sufficiently to relieve pipe of such stresses and strains. In effect, a Dresser Coupling is a "shock absorber". This is a typical advantage of Dresser construction for urban pipe lines. Since 1880, Dresser has been accumulating a wealth of data on pipe joining methods which is available to help solve your problems today. Send us your inquiry; it will receive prompt attention.

★ ★ ★

### DRESSER MANUFACTURING DIVISION

Dresser Industries, Inc., Bradford, Pa.

In Canada: Dresser Manufacturing Co., Ltd.,

60 Front Street, West, Toronto, Ontario.

## RESILIENT!

Style 38...for plain-end pipe    Style 85...for Bellmaster pipe

Style 38 Dresser Couplings and new Style 85 Bellmaster Joints are virtual "shock absorbers" ... because they employ resilient gaskets under compression to seal pipe tightly. This is the key to years of reliable, trouble-free service under the most severe operating conditions, as in heavy traffic. Vibration, deflection and other pipe movements are permitted without leakage.

# DRESSER

*(Continued from page 2)*

by the New York State Dept. of Health for experimentation in the field; fluoride is being added to the water of one town, while another, with a water supply of virtually the same nature, is being studied as a control. The children in the public schools of both towns will be examined periodically for ten years. Brantford, Ont., and Grand Rapids, Mich., add fluorine to their water supplies.

**Phillip C. Saindon**, Supt., 1st Suburban Water Utility Dist. of Davidson County, Nashville, Tenn., is now taking an Engineer's Training Course at Ft. Leonard Wood, Mo. Saindon is an alumnus of Vanderbilt University where he was graduated in engineering. He has also taken two years of law study.

**James Wood**, former Eng. Inspector of Water Works, Board of Water Comrs., Peekskill, N.Y., is now a Resident Engr. in Venezuela for Parsons, Brinckerhoff, Hogan & Macdonald. He has been engaged on the Caracas water supply since November 1944 and has been assisting on the Agua Fria earth-fill dam and the Ospino-Barinas bridges.

Wood was with the Peekskill Water Commissioners from 1928 until 1942, when he was called to active duty as a major in the Marine Reserve Corps. He had enlisted in the Marine Corps in 1917 and left as a captain in 1919.

**Harold F. Rock**, Dist. San. Engr., New York State Dept. of Health, Oneonta, N.Y., has been commissioned in the Army and assigned to Luke Field, Ariz., where he is in charge of all sanitation. Lieutenant Rock reports that the drilled-well supply is so excellent bacteriologically that "real water 'headaches' would now surprise me."

**Albert Otis True**, Civil and Sanitary Engineer for the Proximity Manufacturing Co., Greensboro, N.C., for the past 23 years, died on March 9 after a short illness.

A native of Massachusetts, Mr. True grew up in Newton and graduated from the Massachusetts Institute of Technology. He was commissioned a captain in the Corps of Engineers during the First World War, and before going to Greensboro was associated with Hering and Fuller, New York.

Mr. True, who joined the A.W.W.A. in August 1922, was Chairman of the North Carolina Section in 1940-41.

*(Continued on page 6)*

## *Once Won, Reputations are Held only by Constant Performance*

*Old cast iron pipe in service at Lynchburg, Virginia, since 1828. When recently uncovered and examined, it was found to be in first class condition.*

The high reputation which cast iron pipe enjoys was won by outstanding performance. Cast iron pipe retains high regard of engineers year after year, in city after city, because it continues this performance.

Pipe for use in underground mains must have certain qualities, chief of which are:

- |                     |   |   |
|---------------------|---|---|
| 1. Long Life        | 5. Beam Strength                          | 8. Ability to withstand External Pressure |
| 2. Flow Capacity    | 6. Toughness                              | 9. Imperviousness                         |
| 3. Tight Joints     | 7. Ability to withstand Internal Pressure | 10. Strength and Security of Taps         |
| 4. Tensile Strength |   |   |

Mono-Cast Centrifugal Cast Iron Pipe qualifies on all these points. In addition, its first cost is reasonable and it is economical to install.

*(Continued from page 4)*

**Howard D. Schmidt**, former State San. Engr., Tennessee State Health Dept., is now San. Engr. and Assoc. Chief of Party for the Coordinator of Inter-American Affairs in Chile. Schmidt has been Chief of Party in Panama since January 1943. He is a former Director of the A.W.W.A. and won the Fuller Award for the Kentucky-Tennessee Section in 1940.

**Frank E. DeMartini** has transferred from his post as Chief of the Water and Sewage Section of the San. Eng. Div., U.S. Public Health Service, Washington, to sanitary engineering activities at the Water and Sanitation Investigations Station, U.S.P.H.S., Cincinnati, Ohio. DeMartini was graduated in sanitary engineering from the College of Civ. Eng., University of California, in 1927. For the next eight years he was with the California Dept. of Health and then accepted an appointment as Water Purif. Engr. in the San Francisco Water Dept. He has been with the U.S. P.H.S. for the past six years.

**George J. Rohan** has resigned from his post as Supt., Waco, Tex., City Water Works after twelve years' tenure to organize the Rohan Co. in Waco. The company will distribute water works and municipal supplies and now represents the Hays Mfg. Co., the Hydraulic Development Corp., the National Water Main Cleaning Co., the Rensselaer Valve Co. and several other organizations in the Southwest area.

Rohan, who holds a civil engineering degree from the University of Cincinnati, was Chairman of the Southwest Sec., A.W.W.A., in 1934 and A.W.W.A. Director for the 1939-42 term, and he has been Secretary of the Southwest Sec. for the past three years. He was a first lieutenant in the Engineer Corps, U.S. Army, during the First World War.

**George T. Horton**, President of Chicago Bridge & Iron Co., died suddenly on March 19.

Upon graduation from Rensselaer Polytechnic Institute in 1893, Mr. Horton joined the company which had been founded by his father, Horace E. Horton, and he succeeded to the presidency when his father died in 1912. He was himself a practicing engineer and developed many of the designs used by the company. He belonged to a number of engineering societies and was a trustee of R.P.I. from 1925 until his death. He was associate representative for Chicago Bridge & Iron Co. in the A.W.W.A., the company having joined in 1908.

# 5 PIPE POINTERS For Postwar Plans

When you specify ARMCO Spiral Welded Steel Pipe for new peacetime water mains you are assured these five big advantages:

## 1. Low Installation Cost

Hauling, handling and installation costs are lower; ARMCO Pipe is amply strong without excess weight. Long 50-foot sections mean fewer joints, less assembly work.

## 2. High Flow Capacity

Its spun enamel lining prevents tuberculation—assures highest possible flow capacity.

## 3. Less Leakage

Strong tight joints are assured with any type coupling or by field welding.

## 4. Freedom from Breakage

ARMCO Pipe stretches 25 to 30 per cent before breaking.

## 5. Low Cost Per Year

In the long run ARMCO Pipe costs less per year because of its efficient, reliable service. You can specify it with assurance that it will last as long as you need it.

★ ★ ★

Diameters of ARMCO Pipe are from 6 to 36 inches; wall thicknesses from 7/64 to 1/2-inch. Write us for more information. Armco Drainage & Metal Products, Inc., Welded Pipe Sales Division, 1711 Curtis St., Middletown, Ohio.

WATER CONDITIONING HEADQUARTERS

*(Continued from page 10)*

**The Steel Pipe Research Committee** of the American Iron & Steel Institute, 350 Fifth Ave., New York 1, has established at four permanent forts of the U.S. Army in the eastern United States a steel pipe research project which involves different types of chemical treating equipment, meters and testing equipment. Study of the contrasting results shows corrective trends. The investigation will be continued over a period of years.

Another project, now in its second year, involves a large housing development near the Brooklyn, N.Y., Navy Yards. Steel pipe test loops have been installed in four locations and at different elevations in the various buildings. Inspections, water sampling and complete water analyses are made regularly and complete records are kept. The purpose of these tests is to show the efficiency of a certain type of chemical in controlling corrosion in plumbing systems where a water as aggressive as the New York City water supply from the Catskill and Croton sources is used.

A two-year project in an Ohio city proceeded along different lines. Here the study centered upon the specific use and efficiency of cathodic (electrical) protection of hot water steel pressure tanks and piping contrasted with chemical treatment. A series of household hot water tanks were set up with sidearm coil type heaters, thermostatically controlled, connected by long sections of steel pipe. Some of the tanks were made of black steel, others of galvanized steel. Of all the corrosion control methods used, the cathodic method proved to be the most effective under this specific use.

The Committee studies and compares data concerning different kinds of pipe, with a view toward aiding architects, designing engineers, boards of health, plumbing associations, jobbers and other allied interests. Sizes, thicknesses and properties of pipe are analyzed and relative values are compared.

The sixth edition of "The Control of Communicable Diseases" has just been released by the American Public Health Association, 1790 Broadway, New York 19.

First published in 1916, the volume contains standard recommendations for the administrative control of communicable diseases. This edition has been stamped "official" by the U.S. Public Health Service and the Navy, and has been approved in principle by the Surgeon General of the Army. The National Health Administration of China has recommended its official adoption, and many of its sections were prepared with the cooperation of the Medical Staff of the British Ministry of Health.

The new issue contains 72 chapters, of which 20 are new. All the common communicable diseases are included, as well as those less frequently encountered, such as the so-called "tropical" diseases. It is being translated into Spanish, Portuguese, French, Italian, Chinese and, possibly, Arabic.

"The Control of Communicable Diseases" is obtainable from the Book Service of the A.P.H.A. for \$.35 per copy. Quantity orders are filled at special rates.

The searching eye of the photomicroscope finds gem-like form and brilliance in General Chemical's new Standard Grade Ammonia and Potash Alums. Examine this unretouched enlargement. Note the *unusually uniform size, shape and complete formation* of the crystals. Here are superior physical characteristics which make these General Chemical Crystal Alums outstanding for many industrial operations. They are free flowing without dusts or fines... have faster, more

uniform rates of solution... handle better in conveying equipment and feeding systems.

In addition to visual perfection, the chemical purity built into these alums is held to standards comparable to fine chemical specifications—without increased cost to consumer. The new processing techniques yielding this superior quality are another achievement of General Chemical's continuous research and development of Basic Chemicals for American Industry.

### CRYSTAL ALUM, AMMONIUM

- ★ Rice, thru 8 on 30 Mesh
- ★ Granular, thru 10 on 60 Mesh

### CRYSTAL ALUM, POTASSIUM

- ★ Rice, thru 10 on 30 Mesh
- ★ Granular, thru 30 on 60 Mesh

And in New Containers: Fiber Drums, net wt. 360 and 100 lbs.  
Multiwall Paper Bags, net wt. 100 lbs.

Standard Grade Lump and Powdered sizes have same high chemical quality.

U.S.P. GRADE: Conforming to requirements of pharmacopoeia in all respects... available in all sizes.

**"Pollution Control—A Postwar Public Works Opportunity for the States"** is discussed by Kenneth A. Reid, Executive Director of the Izaak Walton League of America, in the February issue of *State Government*, a monthly magazine published by the Council of State Governments. In the article he says:

The bulk of the work done on water pollution to date has been in refining the treatment processes of water supply plants so the ultimate product delivered to the consumer through the faucet will be a bacteriologically safe fluid. It is a wonderful tribute to our water works engineers and chemists that they have been able to refine their treatment processes, as the source of supply becomes more and more polluted, so that human beings can consume the ultimate product and live to tell the tale. But the breaking point has been reached in numerous important cities and there is a limit to which science can go in making drinking water out of raw sewage and industrial wastes. We have been treating pollution at the wrong end—at the intake of our water supply plants rather than at the outfall of the sewers. We need to reverse that process.

Under the chairmanship of Dr. W. E. Howland, Purdue University, the Indiana Sec., A.W.W.A., the Indiana State Board of Health and Purdue recently sponsored Indiana's Tenth Annual Series of District Meetings for Water Operators. The state is divided into six sections and attendance at meetings in centrally-located cities in each section were enthusiastically attended, the total number of participants being only a few less than in the peak year of 1942. Twenty-seven per cent of the public water supplies in the state were represented by attendants at the meetings.

On Dr. Howland's committee were M. P. Crabill, H. H. Dold, H. J. Draves, F. W. Hartman, Leo Louis, Mike Schmitt Jr. and W. C. Shoemaker. The meetings were devoted to the theme of postwar planning.

While fighting was still going on in the streets of Manila, two automatic chlorinators were ordered by the U.S. Army Engineers from Wallace & Tiernan Co., Inc., for air delivery by the Army Transport Command to Manila. The Army acted on the assumption that the retreating Japanese would destroy at least part of the municipal water system. Col. E. W. Garbisch, N.Y. Dist. Engr., U.S.A., supervised the rush shipment.

Before the Japanese occupation, Manila's modern filtration plant was adequately equipped with several Wallace & Tiernan chlorinators.

## ANNOUNCEMENT

*T*he RENSSELAER VALVE COMPANY is pleased to announce that hereafter it will handle sales of the famous PAYNE DEAN truck-mounted valve operators.

It is believed that these valve operators fill a very definite need. We can recommend them without reservation as they have been proven by over 25 years' service in many of our largest cities.

This equipment warrants your careful consideration—especially during this war emergency. Details, and prices, will gladly be offered by mail—or our local representative will call, if you so desire.

AS IT WAS

TODAY

RENSSELAER VALVE COMPANY, Troy, N. Y.

*(Continued from page 18)*

**St. Louis, Mo., has a postwar program** which includes financial provisions and blueprints for \$19,000,000 worth of water works improvements and \$8,000,000 of sewers. Milton M. Kinsey, Pres., Board of Public Service, recently described the program to the Citizens Postwar Construction Council, Jefferson City, Mo., in the following words:

We hear and read a great deal about postwar planning, but I for one, am very much afraid that there is too much talk and too little action. . . . You would be shocked to know how small an amount of financing has been carried out for postwar projects.

Our Mayor appointed a large committee . . . charged with the duty of investigating each of [St. Louis's proposed] projects and making recommendations as to their suitability. A list of . . . 165 items, totalling approximately 55 million dollars, was submitted to this committee. Due to the size of the task, the 165 projects were divided into eleven main groups, and a sub-committee of the Citizens' Committee was assigned to each of these groups. . . . Our Mayor requested them not to be mere rubber stamps, but to report adversely on any project which did not meet their full approval, and to suggest other projects if they saw fit. Each of these committees reported on the group of projects assigned to it, and in most instances recommended changes in the list proposed by the City officials. In fact, they added projects so that the total reached \$63,000,000 and they assisted in re-study of the bond situation, the final decision being that we could stretch the bond issue to \$43,500,000. Almost universally, the Citizens' Committee recommendations were adopted.

While this procedure was being carried out, lawyers, expert in the legal phases of bond issue procedure, were preparing the ordinances and bond issue proposals to be voted on, and a publicity committee gave radio talks, decorated billboards, issued news stories and passed out handbills to inform the public of the program. One interesting phase of the publicity was a ballot by school children and their families in which they expressed their preference on the various projects proposed. This plan was eminently successful; in fact, so successful, that the 50,000 ballots which were returned could not be analyzed in time to publicize the results before the election.

When election day came, . . . the various items in our bond issue were carried by majorities of approximately five to one. So now we have a program and the money to pay for it.

You will note that our program does not depend on any Federal assistance. It stands on its own bottom. However, if Federal money becomes available, the program can be readily expanded by re-inserting projects which heretofore have been rejected. We, at the City Hall, know now exactly what projects are to be constructed and how much money will be available for each of the items and we are now proceeding to translate this whole program into blueprints. Approximately \$2,000,000 worth of work could be let on contract within a few days after cessation of hostilities, even if the war ended tomorrow, and if the Germans hold out for three or four months, we will have many millions of dollars worth of work ready for taking bids. To do this, we intend to utilize all of the private engineering and private architectural talent which is available in St. Louis, in addition to those on our payroll.

#### YOU GET THIS WITH CAST IRON PIPE

**A Century or more of useful life as a structure.** The proved useful life of Cast Iron Pipe is at least double the estimated life of other pipe materials used for underground mains.

**A Century or more of high capacity as a carrier.** Cast Iron Pipe (except in certain locations) assures 100 years of useful life and 100 years of high carrying capacity. In those locations where tuberculating waters are a problem, lined Cast Iron Pipe insures continued high carrying capacity.

**Low Maintenance Cost . . .** far below that of any other pressure pipe material which has been in use long enough for the recording of conclusive data.

# CAST IRON PIPE

SERVES FOR  
CENTURIES

*(Continued from page 20)*

On March 10, Under Secretary of War Robert P. Patterson added a white star to the Army-Navy "E" pennants of both Wallace & Tiernan Co., Inc., and Wallace & Tiernan Products, Inc., Belleville, N.J. It was the fifth "E" award for each company, one of the few instances where two associated companies in widely separated fields each have been five-time winners.

Wallace & Tiernan Co., Inc., was honored for its activities now exclusively devoted to the production of a variety of war goods including all types of water purification equipment in use by Allied forces. Wallace & Tiernan Products, Inc., won its award for its production of war goods ranging from vital pharmaceuticals to delicate control instruments, aids to navigation, and a variety of confidential and secret items.

The Refinite Corp., Omaha, Neb., has been awarded the Army-Navy "E." Since the beginning of the war, the company's work has been devoted almost 100 per cent to war production. It recently received a contract from the Army for 550 Dyatomite Filters, to be completed by August.

**AS CITIES  
GROW-**

### **WATER SYSTEMS MUST BE EXPANDED**

The growth of cities and towns will ever continue. For every thousand increase in population, there will be a need for more water.

Water Systems must keep a step ahead of the need. They should be of the finest quality and highest efficiency. Furthermore repair and maintenance service must always be obtainable.

For absolute dependability, you will choose Layne Systems. They have scores of years of proven service with hundreds of municipalities, industries, war camps and ship yards. Their records of long life and low upkeep cost have never been equaled.

Right now Layne is offering the co-operation of their engineers on postwar planning. If you are facing an increased water supply problem, write for details, literature etc.

## ARE GREMLINS AT WORK?

**C**orrosion and tuberculation are the saboteurs to guard against in your water mains. Unchecked—these agents of time and wear can cause irreparable damage. So play safe and give those water supply lines a protective lining of thin, dense cement mortar. Applied in place speedily and economically the Centrline way, this sleek new lining will provide a non-corrosive non-tuberculating surface, shielding the underlying metal (whether steel or cast iron), assuring a permanently high coefficient and increased longevity.

Wherever your pipeline is situated, whatever its length—if its diameter is 30" or more—our men can quickly reach and recondition it. Hurry . . . don't let the Gremlins get there first.

### CENTRLINE CORPORATION

142 Cedar Street • New York 6, N. Y.

*The Centrline process is a rapid and economical method of reconditioning pipe lines. It consists of first cleaning the main and then applying, by centrifugal force, a dense cement mortar lining of required thickness, mechanically troweled to a smooth finish. This is done underground, in place.*

***Restores and Protects Pipe-Line Carrying Capacity***

DEPENDABLE because there are no weak spots. Even the barrel can be replaced without shutting off water. Easy to adjust—repair—operate.

Lubricate packing without dismantling.

Self-centering bronze gland cannot bind.

Brass bushing prevents valve rod corrosion.

Cadmium plating protects lower end of rod from pitting.

Lifetime all-bronze non-jamming drain.

Valve seat shuts slowly without hammering.

Not affected by frost.

Waterous Hydrants have been standard in the Northwest since 1886. Made by the makers of Waterous Fire Pumps.

## MARCH 1944 JOURNALS

The Association is holding in reserve complete volumes of the JOURNAL for war-devastated libraries, foreign subscribers and some members serving overseas. There is a shortage of March 1944 JOURNALS. These are urgently needed to complete the sets of Volume 36. Fifty cents will be paid for each copy bought. If you have a copy available, send a postal card indicating your willingness to sell it to:

# s i m p l i c i t y

In design, construction, and operation, Refinite equipment is the ultimate in simplicity, making for maximum efficiency, ease of operation, minimum maintenance cost.

# d u r a b i l i t y

Heavy construction, and highest quality materials go to make Refinite equipment a lifetime servant. Many of Refinite's first installations, over a quarter of a century ago are still giving efficient, economical service.

# e c o n o m y

Simplicity plus durability means economy... low operating cost, savings in manhours, in addition to the savings that Refinite Refined Water afford.

# THERE'S A STRING OF THEM NOW

## ACROSS THE COUNTRY

**Producing Clear, Soft, Iron-Free  
Water for Many Municipalities**

When it's reconversion time, there will be new materials, methods and ideas to be developed and perfected and molded into useful equipment . . . equipment which eventually will find application in important beneficial public works improvements.

In the Water Conditioning Field, however, there is no need to wait for this "miracle" equipment to materialize because

ACCELATORS had already gone through the developing and trying-out stage before the war. There's a string of municipal Accelator installations across the country now

ACCELATORS are doing a lot of different things for a lot of different kinds of water . . . clarifying . . . softening . . . stabilizing . . . removing color . . . taking out iron.

Results are always excellent . . . frequently remarkable.

You can't beat ACCELATORS for Performance and Economy. Would you like Bulletin 1824?

"The National Fire Codes for Flammable Liquids, Gases, Chemicals and Explosives" has been released in a new edition by the National Fire Protection Assn., 60 Batterymarch St., Boston. This supersedes the 1943 edition, and contains 592 pages, 6 x 9 in., bound in red cloth and priced at \$3.00. Of particular value during these war times, it conveniently assembles, under one cover, the many standards dealing with these fire hazards and specifies measures that will assure reasonable safety without great expense or inconvenience.

**Marvin A. Joy**, formerly Sales Mgr. of the Midwestern Div., Chase Brass & Copper Co., Waterbury, Conn., has been appointed Asst. Gen. Sales Mgr. of the Mill Div., Waterbury. **Walter E. Evans**, who since 1940 has been Sales Promotion Mgr. at Waterbury, has been transferred to Cleveland, where he will take over the work formerly carried on by Joy. **John S. Coe**, formerly Asst. to the Sales Mgr. of the Mill Div., has gone to Cleveland to be Asst. to the Vice-Pres. in charge of Cleveland operations.

## Prevent Rusting

**Rusta Restor** cathodic protection, provides permanent protection against rusting of water tanks, piping and steel structures of all kinds.

Initial cost of a complete equipment is about equal to the cost of a good paint job. . . . Operation costs only about 2 mills (i. e. \$0.002) per year per square foot of surface protected.

If your tanks and steel structures are not now protected by this proven low cost method, they should be. No obligation. Send for fully descriptive literature today.

## ASSURANCE OF PROTECTION

*Generator and Pump Drive—  
BUFFALO RA-8 ENGINE,  
Texarkana, Ark.*

A community—or an institution or industrial plant—whose fire protection has been made complete by a Buffalo Engine installation for stand-by pump enjoys a valuable privilege. Its fire insurance rates are less, returning many times the cost of the equipment.

But it is likely that in any community there are too few people who have full under-

standing of this protection. They are engineers who appreciate their design and construction—or operating men who know by experience the reliable starting and smooth-running, constant speed and uniform power delivery of Buffalo Engines.

Write for motor specifications for your files or for comparison—or for any other information that interests you.

(Continued from page 44)

The Filt-R-Stil, a device which has been placed on the market by the American Cyanamid and Chemical Corp., transforms ordinary water into the chemical equivalent of distilled water by filtering it through beds of melamine-derived and other resins. Ion-exchange transforms the dissolved salts in the water to the corresponding acids and in turn absorbs the acids. The final demineralized water has an average salts content as low as 2 ppm. as calcium carbonate, and has been produced as pure as 0.5 ppm. The process also removes dissolved carbon dioxide, thus being of importance to the electronic and electrical field.

The Filt-R-Stil comes in three sizes. The smallest is available for field use by the Armed Forces, where it is used to demineralize water for storage batteries and for electronic equipment. The same size is also available as a bench unit, for use in filling stations, drug stores, photographic studios, chemical laboratories and elsewhere where small quantities of pure water are needed. These units produce 8 to 10 gal. per hour. Their ion-exchange resins are in cartridge form and may be renewed when exhausted. An automatic shut-off indicates when renewal is required.

A 30-gal. per hour unit has been designed for use in larger chemical and research laboratories, hospitals and similar applications. Instead of replaceable cartridges, four units of alternate cation- and anion-exchange resins are provided. They are equipped for reactivation and do not need to be replaced.

Industrial users may specify sizes to suit their needs. Boiler plants, oil refineries, synthetic rubber plants, textile mills, sugar and chemical industries, etc., may thus obtain a continuous supply of demineralized water or other liquids.

**Calgon, Inc.**, has announced the sale of 500,000 lb. of Calgon to the Army Quartermaster Corps. It will be used to produce 1,250,000 lb. of Calgonite, which is Calgon plus a detergent, for use in mechanical dishwashers. Calgon is commercial sodium hexametaphosphate and it is claimed that it cuts the tough soap film which adheres to otherwise washed and rinsed dishes and to dishwashing machines. This film retains bacteria of the intestinal and respiratory groups, and the avoidance of it has materially reduced disease in the Army, Calgon, Inc., states.

(Continued on page 50)

## Journal Indexes

*The Index to the Journal, 1940-1944*, distributed with the March JOURNAL, is a supplement to the *Cumulative Index* published by the Association in 1940. *The Cumulative Index to the Journal and Proceedings, 1881-1939, Inclusive*, is a valuable guide to the contents of all of the Association's material published up to December 1939. Taken together, the two indexes make a handy tool in using your bound volumes of PROCEEDINGS and JOURNALS. The 1881-1939 edition contains 70 major subject headings and a complete author index, as well as a complete list of publications issued by the Association alone and in collaboration with other organizations. 285 pp., cloth bound: price to members, \$1.75; price to members for cash with order, \$1.50; price to non-members, \$2.00.

Extra copies of the five-year index may be purchased at \$1.00 per copy.

AMERICAN WATER WORKS ASSOCIATION, INC.  
500 Fifth Avenue New York 18, N. Y.

*"Until Tomorrow!"*

**108E-R CORPORATION STOP**

When Hays joined up for the duration, we resolved:

(1) To put before all other objectives the winning of the war, and the production of such specialized items for the Army, Navy and Air Corps as our facilities of personnel, experience and equipment enabled us to manufacture.

(2) To continue to supply, to the extent that such commitments permitted, a complete line of Waterworks Materials for our Customers on the Home Front.

To render these multiplied services, much additional floor space has been acquired, modern machinery and equipment installed, and personnel added:

"Tomorrow," meaning P.V. (post-victory), we will be in a better position than ever before to take care of your requirements. Until tomorrow, rest assured that your needs are our first thought after we have taken care of Uncle Sam, our current Number One Customer.

WHENEVER **PIPING** IS INVOLVED

(Continued from page 54)

tax is 5 per cent the rebate allowed was only \$33.93 because no rebate was made on the tires and tubes. The U.S. Bureau of Internal Revenue advises that the sale of automobiles or trucks originally equipped with tires and tubes are not regarded as sales of tires and tubes as such, and therefore that there is no provision in law for a refund in case of purchase by a state or municipal government. The Bureau takes the position that the manufacturer is not allowed to buy tires and tubes tax free and that tax has been paid on these items before they are put on truck or car. See Sec. 316.54 of Regulation 46 of the Bureau. However, when tires and tubes are purchased separately from new equipment the rebate should and will be allowed. Cities usually deduct Federal excise taxes from invoices before payment and submit an exemption certificate to their supplier in place of the amount deducted.

"Rustop," the cathodic protection system installed by the Electro Rust-Proofing Corp., Dayton, Ohio, is credited with having saved the clarifier at Ashland, Ky., when the Ashland Water Dept. found that its clarifier mechanism was corroding and deteriorating at an alarming rate. Periodic inspections have demonstrated that the submerged metal surfaces are now escaping the action of the highly corrosive water, which is drawn from the Ohio River.

(Continued from page 58)

When the Associated Press sent the following story over its wires on March 2, there seemed to be some doubt that *water* was the supply discussed:

*Elizabeth, N.J.*—A meeting of municipal water experts was held here yesterday to discuss a proposed new state water supply program. Elizabeth sent its city engineer—Tom Collins. Perth Amboy was represented by its borough engineer—Louis Booz.

This "postwar plan" was aired in a recent issue of the New York World-Telegram by an inveterate writer of "Letters to the Editor":

*Would Install Heat Coils Under Streets*

It seems to me that a good postwar project would be the installation of radiant heat coils under the streets of the city. The hot water circulating through the pipes would melt the falling snow before it had a chance to turn to ice.

The number of accidents due to slippery streets would thereby be minimized, the project would provide employment for a great many people.

It would eventually solve the snow removal problem.

But would it stop the snow from flying?

(Continued on page 64)

## SAVE FOR VICTORY

**E**VERYWHERE Americans are being asked to "SAVE FOR VICTORY." Water works superintendents, engineers and public officials can do more in this connection by investigating the National Method of water main cleaning. This method restores the carrying capacity of pipe to at least 95 per cent of that of new mains, thereby eliminating the necessity for purchase of new mains. Aside from this the National Method makes possible lower pumping costs, greater delivery, reduced insurance rates and clean water.

*Now is the time to do your part—SAVE FOR VICTORY*

## NEWS OF THE FIELD

This year is the first since the Association was founded in 1881 that there has been no annual convention held. Owing to Office of Defense Transportation rulings the conference was cancelled, and most section meetings have been replaced by regional meetings, planned to involve a minimum of travel and make a limited demand on hotel accommodations.

The officers of the Association who would normally be inaugurated at the conference will take office on July first, as provided in the A.W.W.A. constitution. The new officers are:

**Leonard N. Thompson, President.** Thompson has been Gen. Supt. and Engr. of the St. Paul, Minn.; Water Dept. since 1929. A native of St. Paul, where he was born in 1888, he attended Ripon College, Ripon, Wis., from which he was graduated in 1911. During the next five years he was Engr. with the Omaha Railway and with the St. Paul Water Dept. During the first World War he went to Washington to serve as Designing Engr. in the U.S. Air Service, but he returned to the St. Paul Water Dept. in 1920 to be put in charge of design and construction of the filter plant, softening plant, reservoirs, supply conduits, etc. For two years, 1927-28, he was affiliated with the private contracting firm of D. W. Moore & Thompson.

*(Continued on page 2)*

THOMPSON

LaDUE

BRUSH

(Continued from page 1)

In 1934, Thompson was Chairman of the Minnesota Section and from 1936 to 1939 represented the Minnesota Section on the A.W.W.A. Board of Directors. He is Chairman of the Committee on Joint Administration and Collection of Water and Sewer Accounts. Last year he was Vice-President of the Association under Samuel F. Newkirk Jr., whom he now succeeds.

**Wendell R. LaDue, Vice-President.** LaDue is Supt. and Chief Engr. of the Akron, Ohio, Bureau of Water and Sewerage, with which he has been since 1919. He was born in Ohio in 1895 and was graduated from the Univ. of Southern California with a Civ. Eng. degree. During the First World War he was in the Navy, working on design and tests of submarines and destroyers, thus initiating his professional association with water. At Akron he has been, successively, draftsman, designing engineer and, for the past ten years, Supt. and Chief Engr. responsible for engineering and operation, maintenance and expansion of water works; since 1942 he has added to these responsibilities the directions of engineering operations and maintenance of the sewerage and sewage disposal system.

LaDue was a Trustee of the Central States Section in 1934-37, and in 1938 was one of the instigators in the formation of the Ohio Section, served as Chairman during its first year, and was a Director from the section for the 1940-42 term. He has been Chairman of the Committee on Municipal Water Works Organization since 1941. In 1940 he was Chairman of the Special Committee on the Hill Cup Award and in 1943 was Chairman of the Fuller Award Society, having been a recipient of the Fuller Award in 1939. He is a member of the Publication Committee, the Committee on Water Works Practice and the Subcommittee on Distribution System Safety. He succeeds Thompson as Vice-President of the Association.

**William W. Brush, Treasurer.** Brush has been elected to the post of Treasurer for his fifteenth successive term. A Past-President and Honorary Member, Brush is Editor of *Water Works Engineering* and was formerly Chief Engr. of the New York Board of Water Supply.

**THE O.D.T. DOESN'T BAN FRIENDSHIP**

**W**E'RE sorry that Uncle Sam finds it necessary, through his Office of Defense Transportation, to say that we can't meet in St. Louis, or elsewhere, this year. We're not questioning his judgement, and it's a small sacrifice to make if it's going to help in the smallest measure to hasten the day of permanent peace.

So, we'll be missing you and thinking about you. For 76 years we have considered that *customer* and *friend* were synonyms. We have looked forward from year to year to the chance to greet you, at the A. W. W. A. conventions.

This year our greetings must be extended in this printed form. Don't think they are less hearty for that . . . you have been patient and considerate, because you knew we were striving to do two jobs, take care of your needs, and supply Uncle Sam. We'll continue to do our best.

So again, greetings and good luck until our next convention, we hope in 1946.

**Section Directors** who will take office on July first are:

**Raymond F. Goudey, California.** Goudey is San. Engr. in the Los Angeles Dept. of Water & Power. Born in Everett, Mass., in 1894, he went in 1917 to the California State Dept. of Public Health as Eng.

Asst. armed with a Bachelor of Science degree from M.I.T. With time out to serve as Lieutenant in the Sanitary Corps, in 1918-19, he was successively Chief Chemist and Bacteriologist, Asst. Engr. and Southern Div. Engr., in which posts he had extensive experience in inspection, surveys, estimates, etc., of water and sewerage plants. In his present position he has been responsible for the design and construction of the Wilmington Filtration Plant, a number of chlorination plants, and the bacteriological, chemical, microscopical and spectographic laboratories for control of the Los Angeles water supply.

He is the inventor of a method of scattering dry copper sulfate for algae control in reservoirs and a machine for measuring ultra-violet ray radiation. Goudey was a charter member of the California Section, of which he was Chairman in 1932-33. He has served on the Committees on Safe Handling of Water Works Chemicals, Distribution System Safety, Schools for Operators and Determination of Fluorides; and is now a member of the Committees on Cross-Connections and on Chemical Problems of Water Distribution Systems.

**Manuel J. Puente, Cuba.** Puente is a consulting engineer in Havana, a member of the firm of Puente & Garcia Montes. He was born in Santiago in 1893 and received B.A. and B.S. degrees at the Institute there in 1912.

In 1917 he was graduated from Syracuse Univ. as an Electrical Engr. and during his student days in the United States worked in the East Pittsburgh Westinghouse shops. In October 1917 he returned to Cuba and from then until 1924 did electrical engineering work with various sugar companies. After a year and a half as an independent sugar producer, he joined the International Brewing Co. of Cuba as Chief Engr. From 1931 to 1940 he was Resident Engr. Inspector for the Fuller Construction Co. of New York on the construction of and, later, as Supervising Engr. of the

(Continued on page 6)

## Is Your City *Hungry* for Soft Water?

Your citizens have learned from other communities the many pleasures and savings that soft, iron-free water brings . . . they know that better water means better living, happier homes. They, too, want soft water. You can satisfy that hunger, no matter what your water problem may be . . . your city can have sparkling clear, soft, iron-free water. Refinite offers a complete line of water refining equipment for municipal water treatment, and will analyze your water supply and design equipment to solve your individual problem. Consult Refinite now. There's no obligation.

  
**The Refinite Corporation**

109 Refinite Bldg. Omaha 8, Nebr.

(Continued from page 4)

National Hotel of Cuba. In these capacities he supervised the installation of all electrical, mechanical, sanitary and water facilities, including steam boilers, a 0.4-mgd. zeolite plant and storage tanks. From 1929 to 1934 he was Cons. Engr. for the city of Havana, reorganizing the Bureau of Gas, Electricity and Mechanical Installations, and for the next two years was Technical Director of the Havana Water Works, having the supervision of the 80-mgd. system. In 1936, he began his private consulting practice, and was engaged by Havana to co-author a plan for the complete rehabilitation and expansion of the water works system at a cost of \$15,000,000.

**William B. Gibson, Florida.** Gibson has been Supt. of Utilities, Fort Myers, Fla., for the past three years. He was born in Columbus, Ga., in 1907, and studied at Newton, Ala., Institute and Louisiana State Univ. After five years as house foreman with a sugar company in Florida he became Supt. of the Water Treatment Plant at Fort Myers, in which post he served for eight years. In 1941 he represented the Johns-Manville Sales Corp. in Florida and the next year was appointed to his present position. Gibson was a Trustee of the Florida Section in 1938-40 and Chairman in 1941. He

was chairman of a committee which drew up the Florida licensing plan for water works operators.

**Carl J. Lauter, Four States.** Lauter is Chem. Engr. in the U.S. Engineers Office, Washington, D.C., with which he has been since 1922. At first in charge of purification and Director of Research of the Washington water supply, since 1925 he has been engaged in special researches on coli aerogenes media. Recently he has collaborated with the Engineering Dept. on future designs and operation of water treatment plants. He is a private consultant on swimming pools and miscellaneous sanitation. Born in Quincy, Ill., in 1889, Lauter holds B.S. and M.S. degrees in Chem. and San. Eng. from the Univ. of Illinois. Before World War I he was Asst. Prof. of Chem. at the Univ. of Illinois and the Univ. of Wisconsin. During the war he was Naval Ordnance Inspector of steel foundries in Milwaukee. In 1935, Lauter

(Continued on page 8)

*Reminding you that*  
**DRESSER  
 COUPLINGS**

**offer these 5  
 major advantages**

*plus*

**... a complete line of types  
 and sizes for any application**

**THERE'S A DRESSER COUPLING FOR ANY SIZE PIPE**

- Style 38** Steel coupling for plain-end steel and cast-iron pipe, sizes range from  $\frac{3}{4}$ " to 24", and larger.
- Style 40** Long Sleeve . . . to span gaps between pipe ends, as at final closures,  $\frac{1}{2}$ " to 24" diameter.
- Style 85** "Bellmaster" Joint, for Bellmaster cast-iron pipe. Sizes range from 3" to 12" CIP.

**THERE'S A DRESSER FITTING FOR YOUR SMALL PIPING**  
**Boltless Fittings**

**Style 65**  
 NO-THREAD Fittings, malleable, for exposed piping, available in all standard shapes.

**Style 84    Style 88    Style 90**

**THERE'S A DRESSER REPAIR FOR ANY EMERGENCY**

**Style 82**—Adjustable repair sleeve for CIP lines 4.7" to 9.07" O.D.

**Style 60**—Clamp for repairing bell and spigot joints 3" to 60" sizes.

**Style 57**—Sleeve for repairing breaks in straight pipe, 2" to 12" CIP.

It pays to get "back to fundamentals" in pipe joining. It pays to remember the manifold advantages offered by Dresser Couplings when you have a pipe joining problem. Behind Dresser are 65 years of experience which save time and money wherever pipe is joined.

Savings are for the life of the pipeline. Properly applied, Dresser Couplings outlast the installation . . . with the lowest maintenance.

Dresser has accumulated "the most complete set of pipeline data in the world". Its benefits are yours. On your next pipe joining problem, call us or write.

**DRESSER MANUFACTURING DIVISION**  
 Bradford, Pennsylvania  
 One of the Dresser Industries

In Texas: 1121 Rockwell Street, Sec. 16, Houston, Texas.  
 In Canada: Dresser Manufacturing Co., Ltd., 60 Front Street, West, Toronto, Ontario.

**SIMPLICITY**

**... a few simple,  
 interchangeable  
 standard parts.**

**SPEED**

Dresser Couplings are assembled with a simple wrench in any kind of weather—at a speed of two man-minutes per bolt.

**FLEXIBILITY**

Dresser Couplings permit 4° deflection or more between pipe sections (depending on diameter) and up to  $\frac{3}{8}$ " movement longitudinally.

**PERMANENT TIGHTNESS**

Dresser Couplings stay tight for life of the line. The first Dresser-coupled line was laid at Malta, Ohio, in 1891—and is still in operation.

**ECONOMY**

The true cost of a pipeline is not the first cost in material and labor—but the **total** cost over the life period. Dresser Couplings give lowest cost over the years.

**DRESSER**

**COUPLINGS**

was Pres. of the Maryland-Delaware Water & Sewerage Assn., and in 1940-41 served the same group as Secy.-Treas. He was chairman of the Four States Section in 1939, and in 1937 was chairman of the Association's Water Purification Div. He is a recipient of the Fuller Award.

**Jesse J. Woltmann, Illinois.** Woltmann is a consulting engineer in Bloomington, Ill. He was born in Nokomis, Ill., in 1888 and holds two degrees in Civ. Eng. from the Univ. of Illinois. After graduation, he became City Engr. for the cities of Anna and Nokomis, which post he held for seven years and during the same period he served on assignments with a construction company at several Army installations and with the Constr. Div. of the Army in Washington, D.C. He has been in private practice in Bloomington since 1921, engaged on water works and sewerage projects. From September 1943 to December 1944 he was Acting Chief of the Illinois State Water Survey, during the Army service of Arthur M. Buswell. Woltmann was Vice-Chairman of the Illinois Section during 1932-33 and chairman for the following term.

**Herbert S. Grove, Minnesota.** Grove is Gen. Mgr. of the Board of Water Comrs., Stillwater, Minn. Born in Nebraska in 1891, he received his education in Stillwater where he was Plant Engr. from 1906 to 1918, Asst. Engr. in 1918-29, and Supt. and Engr. from that time until his appointment as Gen. Mgr. in 1938. Grove served his section as trustee in 1941-42, and was vice-chairman in 1943 and chairman the next year. He has acted as chairman of the Water Works School for Continuation Study, Univ. of Minnesota, and is the author of several publications.

# THERE'S A STRING OF THEM NOW

## ACROSS THE COUNTRY

**Producing Clear, Soft, Iron-Free  
Water for Many Municipalities**

When it's reconversion time, there will be new materials, methods and ideas to be developed and perfected and molded into useful equipment . . . equipment which eventually will find application in important beneficial public works improvements.

In the Water Conditioning Field, however, there is no need to wait for this "miracle" equipment to materialize because

ACCELATORS had already gone through the developing and trying-out stage before the war. There's a string of municipal Accelator installations across the country now

ACCELATORS are doing a lot of different things for a lot of different kinds of water . . . clarifying . . . softening . . . stabilizing . . . removing color . . . taking out iron.

Results are always excellent . . . frequently remarkable.

You can't beat ACCELATORS for Performance and Economy. Would you like Bulletin 1824?

# INFILCO

INCORPORATED

325 W. 25th PLACE, CHICAGO 16, ILL.

(Continued from page 8)

**J. R. Cortese, Montana.** Cortese is Engr. and Water Supt. of Livingston, Mont., where he planned and constructed the water supply system. Born in New York City in 1890, he was educated in St. Paul, Minn., and at Marquette Univ., Milwaukee. He was engaged in the mining industry in Idaho and Montana before going to Livingston. A member of the A.W.W.A. for the past twenty years, he was Vice-Chairman of the Montana Section in 1930 and Chairman the following year.

**Harvey P. Jones, Ohio.** Jones has been a consulting engineer in Toledo, Ohio, since 1926; from 1926 to 1944 under the name of H. P. Jones & Co., and since 1944 as partner of Thomas B. Henry in the firm of Jones & Henry. In 1918-26, he was manager of the mid-west office of Fuller & McClintock, Cons. Engrs., New York City. For two years before that he was Toledo San. Engr. He was born in Illinois in 1891 and took a B.S. in engineering at the Univ. of Michigan in 1916. Jones, who has been a member of the Association for 23 years, has served as Chairman and on the Board of Trustees of the Ohio Section.

**Albert R. Davis, Southwest.** Davis has been Supt. of the Austin, Tex., Water Dept. since 1921. A native of DePauw, Ind., he studied at Taylor Univ. Academy and Indiana Univ. He was in military service in 1917-19, and rose through the ranks to a commission in Field Artillery. He completed his education after his return from France, and then took his first position, as Asst. Engr. to the Texas Fire Insurance Com. in 1920-21. During the thirties he was on Austin's Special Engineering Staff for PWA projects. Davis was a Trustee of his section in 1935 and served as Vice-Chairman in 1938, holding the chairmanship a year later. He is a member of the Association's Com. on Location Records and Maintenance of Mains and Services.

**GET READY NOW—  
TO LAY PIPE FAST**

**ALCO ELECTRIC-  
WELDED STEEL PIPE**  
**is the Pipe to Lay**

ALCO ELECTRIC-WELDED STEEL PIPE is extensively used and extremely popular. And for good, solid reasons!

It is strong, dependable, durable, long-lived. It is smooth, gives maximum flow and capacity. It is light in weight, easy to handle—comes in long lengths, requiring minimum joints—advantages that mean faster, lower-cost installations.

Don't wait for the postwar flurry. Plan now to use ALCO ELECTRIC-WELDED STEEL PIPE for water, sewer, gas and oil lines. Now is the time to get ready. Tell us your requirements and let us help you.

*(Continued from page 10)*

**The Sanitary Engineering Division** of the Procurement and Assignment Commission, WMC, will be thrown into reverse to facilitate the return of sanitary engineers to civilian life. The Division's Subcommittee on Personnel, appointed early in 1943, co-operated with the Army and the U.S.P.H.S. to: (1) determine the military and civilian needs for sanitary engineers; (2) develop a roster of all sanitary engineers; and (3) establish a well-balanced allocation to meet the military needs without depriving the civilian population of essential sanitary services. The roster eventually developed contained the names of 3,559 sanitary engineers, of whom 1,503 are commissioned officers (959 in the Army, 411 in the U.S.P.H.S. and 133 in the Navy).

State advisers, usually chief sanitary engineers of state health departments, classified 799 sanitary engineers as "essential" for the protection of civilian public health, and designated another group as "available" for military service.

Because of the success of this procedure it will be continued for the duration of the Pacific war and will be adapted for a program to facilitate "at the proper time" the release of sanitary engineers who are essential "to public health, welfare or interest." There will be three steps for justifying the release of such engineers: (1) A summary statement from the prospective employer, showing the need for sanitary engineering services of the officer concerned; (2) Certification by the state adviser that the release of the sanitary engineer is necessary in the interest of public health; and (3) The favorable recommendation of the Office of Procurement and Assignment Service, WMC. Application for release must be initiated by the officer concerned, who should submit documentary evidence in these three categories, through channels, to the Adjutant General, Separations Service, Munitions Building, Washington, D.C. Instructions are contained in War Dept. Circular No. 485, Sec. III, issued Dec. 29, 1944.

The adviser system will also provide a program for advising and counselling sanitary engineers as they leave the Services and return to civilian endeavor.

Available from the office of E. S. Tisdale, Procurement and Assignment Service, War Manpower Commission, Washington 25, D.C., is a mimeographed bulletin containing further details of the procedures to follow to qualify for release, as well as full descriptions of sanitary engineering opportunities in various fields from federal employment through private practice, a discussion of the rights and opportunities of veterans under the "G.I. Bill of Rights," and a complete list of the members of the Committee and the names of the state advisers.

## When the Bell Rings...

This advertisement appeared in June, 1943. Since that time many have started their post-war planning with Simplex. If you haven't yet begun, we feel the context of this advertisement is as timely as it was two years ago... but the need is more urgent. BLUE PRINT NOW... and act.

**P**lant superintendents, council members, city commissioners, and other officials, all are talking about war and its many urgent problems... and just as earnestly these same men are thinking of the urgent problems they will face after the war.

We sincerely believe that much of your post-war planning can and should be started now, when you and your consulting engineers have the opportunity to analyze your over-all program and prepare a plan of action which is commensurate with your future needs. Then, when the bell rings and you've torn up the last set of priority papers, you will be ready—engineered for immediate progress.

Simplex Valve & Meter Company has been collaborating in such long-time planning for over forty years. Our outlook, therefore, is broad and is based on sound experience. We know many of the problems involved and can offer the solution to most of them. We are prepared to help you plan for the future — starting today.

**SIMPLEX VALVE & METER COMPANY**  
6784 UPLAND STREET, PHILADELPHIA, PENNA.

*(Continued from page 12)*

**Past-Pres. Samuel B. Morris**, Gen. Mgr. and Chief Engr., Los Angeles Dept. of Water & Power, has announced a number of changes in his staff, due to the department's policy of retiring its employees when they reach the age limit. Laurence E. Goit moved into the position of Chief Engr. and Deputy Gen. Mgr. upon the retirement of William W. Hurlbut, who reached retirement age in December but was retained to assist Morris, who had assumed his position only a few months previously. Goit was succeeded by Burton S. Grant. Charles P. Garman, former Engr. of Station Design, has been made executive head of the power system, and William S. Peterson, former head of the Design and Construction Div., has been made Asst. Chief Electrical Engr.

**Past-Pres. William W. Hurlbut**, who retired as Chief Engr. of Water Works and Deputy Gen. Mgr. of the Los Angeles Dept. of Water & Power on March 31, was feted shortly thereafter by the publicly-owned utility which he served for 37 years. He was presented with a number of gifts, including a bound book of letters and telegrams from directors, past presidents and other officers of the A.W.W.A. and many men prominent in the water works field. It was tendered on behalf of the Association by C. P. Harnish, California Section Chairman.

**Laurence E. Goit**, who has been promoted from Asst. Chief Engr. of Water Works to Chief Engr. of Water Works and Deputy Gen. Mgr. of the Los Angeles Dept. of Water & Power, succeeding William W. Hurlbut, has been with the utility since 1924. He will administer a \$190,000,000 plant which collects the waters of Owens Valley and Mono Basin and transports them some 300 mi. to serve the 1,750,000 people of the Pacific Coast metropolis.

Goit is a member of the A.W.W.A. Committee on Laying Cast-Iron Pipe and of the Committee on Pipeline Coefficients. He was awarded the Goodell Prize in 1937 for development of equipment for the application of protective coatings to steel water pipe. During World War I, Goit served as an ensign in the Naval Transport Service.

**Burton S. Grant**, who started at the Los Angeles Dept. of Water & Power as a draftsman 20 years ago, becomes one of the youngest executives in the organization as he assumes the duties of Asst. Chief Engr. of

*(Continued on page 16)*

## Simple and low-cost operation . . .

### a corollary to the "ALOXITE" porous underdrain system

**LOW COST AND EASIER OPERATION** are inherent with the "ALOXITE" ceramically bonded aluminum oxide porous plate underdrain system for rapid filters. Its use—

- Eliminates all graded gravel
- Provides complete and uniform backwash
- Reduces operating heads

The sectional perspective drawing shows the simplicity of construction. There is nothing to be disturbed by a violent or uneven backwash. All the difficulties resulting from upsetting of graded gravel and filter media are eliminated. Think what this may mean to you!

With the filter media resting directly on the "ALOXITE" plates, there is only one material to handle if bottom inspection is necessary. And this work can be completed in a very few minutes.

Users of the porous underdrain system consistently report that less wash water is required to maintain clean filter media. This reduces backwashing time. Both of these features provide distinct savings.

Furthermore, smaller pressure loss through the underdrain system plus reduced filter heights result in lower filtering and backwashing operating heads . . . an additional aid in reducing overall costs.

These advantages can be secured in your plant by using the "ALOXITE" porous filter bottom. For more information write The Carborundum Company, Refractories Div., Dept. V3, Perth Amboy, N. J.

"CARBORUNDUM" and "ALOXITE" are registered trade marks of, and indicate manufacture by, The Carborundum Company

## IMPORTANT GENERAL CHEMICAL PRODUCTS FOR WATER & SEWAGE TREATMENT

### ALUMINUM SULFATE

Equally Efficient For Coagulation of Water & Sewage

Ammonia & Potash Alums • Aqua Ammonia • Anhydrous Bisulfite of Soda • Sodium Silicate • Sulfuric Acid • Disodium Phosphate • Trisodium Phosphate • Tetrasodium Pyrophosphate • Sodium Fluoride • Sodium Sulfite

### BAKER & ADAMSON

LABORATORY REAGENTS and FINE CHEMICALS

For almost half a century General Chemical products have been a familiar sight in American Industry. So numerous are their applications, and so vital their functions, that they have long been recognized as basic chemicals which help form the backbone of many principal industries.

Year after year purchasing and operation executives select and specify General Chemical Products, knowing that the quality and utility of these chemicals have been proved in production . . . meeting demands of the day.

Because General Chemical's research and manufacturing programs are both practical and progressive, they are geared to Industry's ever-changing requirements and anticipate its future necessities. That is why General Chemical products today are for today's processes . . . that's why General Chemical products of tomorrow will meet the new demands of the industrial world!

**Charles H. Eastwood**, General Advertising Manager of Wallace & Tiernan and Associated Companies, Newark, N.J., died on April 27 in a hospital in Pasadena, Calif., after a relapse from a heart attack suffered six weeks previously.

Mr. Eastwood was born and educated in England and emigrated to Canada with his family as a young man. In World War I he went overseas with a medical unit of the Canadian Army and served with distinction, winning a number of decorations. Upon his return he became associated with the firm of Nordyke & Marmon, manufacturers of flour milling machinery, and in 1924 he joined the Wallace & Tiernan organization to work in their flour milling activities in the Southwest. Later he was manager of the district office in Jacksonville, Fla., and then was transferred to the head office in Belleville, N.J., where he was at first engaged in export sales and then became General Advertising Manager. He was also responsible for the management of the Decco Process (citrus fruit decay control) and, for several months during 1943 and 1944, the Flour Milling Service Division. However, during the past few years, he was seriously ill and in the fall of 1944 he was given a temporary transfer to California. His health was improving when the last heart attack occurred.

An Active Member of the A.W.W.A., Mr. Eastwood planned a membership drive early in 1935 which culminated at the Cincinnati Convention in April of that year and brought one of the largest increments of membership in the Association's history. He also made many other valuable contributions to the Association's promotional activities.

**BUFFALO METER COMPANY**  
Established 1892      2914 Main St., Buffalo, N. Y.

do you have this valuable  
80-page manual?

## Hypo-Chlorination of Water

Sanitation HTH is  
available in cases of  
nine 5-lb. cans and  
in 100-lb. drums.

"Hypo-Chlorination of Water" is a complete reference manual on the use of high-test calcium hypochlorite in the modern practice of safeguarding water supplies. Written in simple, non-technical language, it covers all phases of standard sanitation practice including instructions for emergency use; tables and charts showing qualities of Sanitation HTH required for many specific needs; algae and alkalinity control. Fully illustrated. Many schools have requested copies for student use in courses in water treatment.

Though more than 25,000 copies—in five editions—have been distributed to those interested in modern water and sewage treatment, Mathieson again offers the latest edition, free of charge, to newcomers in the profession and to those whose copies have "disappeared".

Send us a postal card—we'll mail your copy.

*P. S. Checked your stocks of Sanitation HTH recently? Remember—in an emergency you'll be glad to have an ample supply on hand.*

**Robert E. Horton**, Consulting Hydraulic Engineer, died of a heart ailment on April 22 at his home at La Grange's Mills, N.Y.

Mr. Horton was born 69 years ago at Parma, Mich., and received a Bachelor of Science degree from Albion College, Albion, Mich., in 1897. Thirty-five years later his alma mater awarded him a Doctor of Science degree. Mr. Horton's first job was as assistant engineer for the U.S. Deeper Waterways Commission. Two years later he became an assistant engineer in the U.S. Geological Survey, where he remained until 1906, when he accepted a post as engineer in the U.S. Hydraulic Survey. Since 1911 he had been in consulting practice, which included an appointment from 1911 to 1925 as hydraulic expert of the Department of Public Works and the Attorney General's Department of the State of New York. From 1922 until 1930 he represented the State of New Jersey before the United States Supreme Court in the Delaware River case, and in 1924-32 he was consulting engineer to the Board of Water Supply, Albany. He was consultant to a number of committees and commissions, and was chairman of the Board of Consultants, Flood Control, U.S. Department of Agriculture, from 1940 until his death.

Mr. Horton wrote eight technical books and 150 scientific papers on hydraulics, a number of which appeared in this JOURNAL, and was the inventor of a water-level gage and a joint for wood stave pipe. He was a Senior Member of the Association, having joined in 1911.

**W. J. Whaley**, Supt. of Water Works at Winder, Ga., for the past nine years, has been appointed Supt. of Water Purif. at Greenville, S.C. He succeeds Charles Floyd who retired because of ill health after 23 years with the Greenville Water Dept.

# NOW pipes as small as 30 inches

30" Lining Machine leaving a pipeline that has just been Centrlined

## ... reconditioned by Centrline

Here's good news! If the diameter of your pipeline is 30" or more . . . whatever its length . . . wherever situated—Centrline men and equipment can quickly reach and recondition it.

The Centrline process is a rapid and economical method of reconditioning pipe-

lines. It consists of cleaning the main and applying by

centrifugal force, a dense cement mortar lining of required thickness, mechanically troweled to a smooth finish. This new inner coating of protective cement will permanently resist the invasion of tuberculation and corrosion—and will restore and maintain a high carrying capacity.

Don't wait until it's too late . . . let Centrline clean and re-line your pipelines now. In that way you'll safeguard your initial investment.

The sleek new lining of a pipe that has been Centrlined

RESTORES AND PROTECTS PIPE-LINE CARRYING CAPACITY

*(Continued from page 20)*

**Ira E. Wilson**, for the past 38 years Superintendent of the Faribault, Minn., Water Department, died on April 22 after a long illness.

Mr. Wilson was born in Missouri in 1869 and as a small boy migrated with his family to Oregon by covered wagon. He moved to Faribault in the 1890's and went to work as a day laborer for the city water department. In 1907 he was made superintendent of a plant with a bonded indebtedness of \$80,000 and a book value of approximately \$11,000. Under his hands, the department has come out of debt and now has investments of \$61,700 and a book valuation of almost \$600,000. Water main footage increased from 65,674 to 256,418. Control valves increased in number from 148 to 608, the 103 hydrants of 1907 have been doubled in number, and where there were 447 meters there are now 2,308. At the time of his death, Mr. Wilson was making plans for further extensions. He was self-educated and widely read in academic and engineering subjects.

## MARCH 1944 JOURNALS

The Association is holding in reserve complete volumes of the JOURNAL for war-devastated libraries, foreign subscribers and some members serving overseas. There is a shortage of March 1944 JOURNALS. These are urgently needed to complete the sets of Volume 36. Fifty cents will be paid for each copy bought. If you have a copy available, send a postal card indicating your willingness to sell it to:

**AMERICAN WATER WORKS  
ASSOCIATION, INC.**

500 Fifth Avenue New York 18, N. Y.

**F**or twenty centuries engineers have experimented with many pipe materials for underground mains. About three centuries ago a new material—cast iron—first came into use. From then until now, the performance of cast iron pipe all over the world has made it the recognized *standard* by which other materials might well be measured, when under consideration for permanent construction.

This is so because of the proved long life and proved low cost of maintenance of cast iron pipe. Evidence of long life is supplied by cast iron lines still functioning in Europe after more than 200 years of service, and in England and America after more than 100 years of continuous satisfactory performance. Evidence of lower cost of maintenance is found in comparative cost records supplied by Water Works Superintendents of 195 cities.

Such evidence breeds trust and confidence. For example, where buried pipe is hard to get at for repairs or replacements, as in sewage treatment plants, more than 95% of all pipe installed is cast iron pipe.

Cast Iron Pipe Research Association, Thomas F. Wolfe, Research Engineer, Peoples Gas Building, Chicago 3, Ill.

*(Continued from page 22)*

**Capt. Emil T. Chanlett, Sn.C.**, is now in Tegucigalpa, Honduras, working on an environmental sanitation project for the Institute of Inter-American Affairs, with which he has been since May 1943. In July and August of that year he was in Bolivia engaged in a health and sanitation study of Bolivian tin and tungsten mines, and for the next eighteen months worked on environmental sanitation in the Amazon River Basin under Dr. H. G. Baity and Major E. G. Wagner. For the two years subsequent to his graduation from the Univ. of North Carolina in 1941, Captain Chanlett was an Asst. San. Engr. (R) in the Div. of Industrial Hygiene, U.S.P.H.S.

**Harold M. Dilworth**, Field Engr. in charge of the development of water supplies for airports in western Canada, is now located in Edmonton, Alta., where he is supervising water supply and sewerage systems for all airports on the Northwest Staging Route between Edmonton and the Yukon-Alaska boundary. Dilworth, who has been with the Dominion government for the past five years, was formerly Township Engr. and Water Works Supt. of Etobicoke, Ont., the first municipality in Canada to install a zeolite water softening plant.

## New-design equipment for removing water hardness...

### PERMUTIT Spaulding Precipitator

**Cuts detention time, saves chemicals,  
takes only 1/2 the space of former methods**

**PERMUTIT SPAULDING PRECIPITATOR** removes water hardness, dirt and color by the sludge blanket process. This new-design equipment cuts detention time, saves chemicals, takes only half the space of former methods. Present installations handle up to 120,000,000 gallons daily.

It removes water hardness, dirt and color by the sludge blanket process, cutting detention time and saving chemicals. It requires only half the space of former methods. No wonder engineers, in blueprinting their water improvement plans, specify the Permutit\* Spaulding Precipitator.

If *your* postwar program includes water conditioning—and it should—write for details of this modern, efficient equipment. Address The Permutit Co., Dept. G2, 330 West 42nd Street, New York 18, N. Y. or Permutit Co. of Canada, Ltd., Montreal.

## Available Now on Your Priority

This patented fish control method employs modern electronics in overcoming a serious operating and maintenance problem. Fish of all sizes are kept at a *safe distance* from intake structures, or screens, by the use of an Electronic Control Unit. This equipment, generating special electrical impulses, energizes an electrode system designed and engineered for your particular fish control problem.

The Burkey Electric Fish Screen has been thoroughly proven through years of service in Condensing Water Intakes, Hydroelectric Plants, Water Systems and Industrial Pumping Installations. DOES NOT STUN OR KILL FISH.

## DO YOU NEED A GATE VALVE?

Here is an actual photograph of a typical gate valve installation in a water works improvement project. This point in the piping system is a key spot that called for a valve that would be ready for instant operation anytime day or night when emergencies or special needs arose. There dared not be any failures when the valve had to be used. It is significant that a MUELLER-COLUMBIAN valve was chosen—not only for this spot, but for all the other places where new valves were needed in the system.

Any water works man who knows valves will tell you that MUELLER-COLUMBIAN Gate Valves last for generations. The EXCLUSIVE 4-point wedging mechanism of the gate assembly is the heart of this valve. There are only six simple parts which, by means of the wedging principle employed, apply the pressure of closing to the outer edges of the discs at four equal points. There can be no sprung or warped discs and therefore no leaks. The ball-joint design of the packing gland and follower positively prevents binding of the stem at any time. The disc and seat rings and all vital working parts are of everlasting MUELLER bronze. The close-grained gray iron bodies have extraordinary thickness of section for the indicated pressure. The result is a valve that will operate for years with a minimum of attention and negligible maintenance costs. . . Get the valve that engineers specify—the valve water works men prefer. Demand MUELLER-COLUMBIAN. Write for our latest folder that gives the full facts in condensed form for quick reading.

## Maximum Protection and Peak Capacity

Time and again engineers specify Barrett  
Coal-tar Enamels.

They do so because they know from experience that  
Barrett Coal-tar Enamels prove their economic value.

They know too that pipe and penstocks lined with  
Barrett Coal-tar Enamels have smooth, mirror-like  
surfaces that increase the flow of water and main-  
tain a peak capacity undiminished over a long  
period of years.

Barrett Coal-tar Enamels meet  
the American Water  
Works Association's Standard  
Specifications 7 A.5  
and 7 A.6—1940.

tion men in the use of  
Barrett Enamels.

*H.M.S. Agamemnon laying  
the first Atlantic cable.*

## Famous Facts

... The first Atlantic cable was laid between Cape Breton, Nova Scotia, and Newfoundland. In 1857 the cable was completed to Ireland and the first messages sent between New York City and Europe the following year.

... During the same decade, Bitumastic Enamel — the first product of its kind — was developed for the protection of underground and underwater metal surfaces. For many years, it has given maximum corrosion protection to pipe lines, and other steel and iron structures in industry all over the world.

... For the best pipe line protection in every type of corrosive soil and climate, Bitumastic Enamel has an unequalled long-time service record. Used as a spun lining, it prevents tuberculation and assures maximum flow capacity; as a coating it gives longer pipe line life. Bitumastic Enamels can be applied by your own workmen under our supervision or by our contract department.

%Proportioneers% High Pressure Chem-O-Feeder, paced by meter, automatically feeds hypochlorite at Middlebury Water Dept.

End your water treating problem with %Proportioneers% Chemical Feeders and Hypochlorinators . . . treat your water supplies automatically! The High Pressure Chem-O-Feeder, shown above, starts, varies and stops dosage of chemical as the water comes on, fluctuates and tapers off. The meter control prevents dangerous undertreatment or unpleasant taste resulting from wasteful overtreatment. Hydraulic operation of Chem-O-Feeder insures unfailing opera-

tion, without the use of electricity or other power source.

%Proportioneers% High Pressure Chem-O-Feeder injects against line pressures up to 200 lbs. per sq. in. and is equipped with "See-Thru" plastic pump head which clearly shows operation of plunger and check valves. A "fluid sealed yoke" keeps air from reaching packing gland, thus preventing build-up on plunger, cutting of packing and subsequent packing failure.

Other %Proportioneers% are available to meet every operating condition. Information on request.

## SEVENTEEN YEARS OF UNINTERRUPTED SERVICE

*...not one minute for Repairs!*

Since September, 1927 when this De Laval motor-driven geared compressor was placed in service in the City of Houston Sewage Treatment Plant, it has operated better than 99 per cent of the time, without ever requiring repairs or overhauling.

Such operation is typical of De Laval dependability. De Laval water works pumps installed more than thirty years ago still give excellent service. De Laval geared turbine ship propulsion units have traveled upwards of 2,000,000 miles without requiring major repairs; and De Laval worm reduction gears have operated for years hidden in the abrasive dust of cement plants.

**AS CITIES  
GROW-**

### **WATER SYSTEMS MUST BE EXPANDED**

The growth of cities and towns will ever continue. For every thousand increase in population, there will be a need for more water.

Water Systems must keep a step ahead of the need. They should be of the finest quality and highest efficiency. Furthermore repair and maintenance service must always be obtainable.

For absolute dependability, you will choose Layne Systems. They have scores of years of proven service with hundreds of municipalities, industries, war camps and ship yards. Their records of long life and low upkeep cost have never been equaled.

Right now Layne is offering the co-operation of their engineers on postwar planning. If you are facing an increased water supply problem, write for details, literature etc.

Four members of the Wallace & Tiernan Co. Labor-Management Com. recently christened a hospital ambulance plane and five ambulances at the Oklahoma City, Okla., plant of the Douglas Aircraft Co. The equipment was bought through the sale of war bonds to Wallace & Tiernan employees during the Sixth War Loan Drive. The plane was named "Reporting Sir" for the bulletin sent regularly to Wallace & Tiernan employees in the armed forces, in ceremonies which coincided with the opening of the Seventh War Loan Drive at the Douglas plant.

The decrease in the typhoid fever hazard in upper New York State is described in a report in a recent issue of *Health News*, weekly bulletin of the New York State Dept. of Health:

A total of 480 typhoid carriers, was under supervision in upstate New York at the close of 1944. Forty-one new carriers were added to and 35 were removed from the register during the year. Twenty-three were discovered as a result of epidemiological investigation of sporadic cases of typhoid; four, by means of release cultures;

## ... BUT A FIRE HYDRANT'S LIFE ALSO HAS A STERNER SIDE ...

The children who revel in the refreshing spray from the neighborhood fire hydrant on a hot summer day will have far more cause to be grateful for the presence of the hydrant in case of fire in one of their homes.

You can be SURE that your hydrants are immediately responsive if they are Kennedy SAFETOPS. The simple straight-line mechanism . . . large elbow, valve opening and stand-pipe . . . wear-resistant and long-lived operating parts minimize maintenance expense . . . and several additional refinements of design assure dependable, trouble-free service.

Bulletin sent on request

THE KENNEDY VALVE MFG. CO. • ELMIRA, N. Y.

# KENNEDY *Safetop* HYDRANT

(Continued from page 52)

ten accidentally, as a result of routine culturing; and one on the basis of information furnished by the New York City Dept. of Health. Three previously discovered carriers were added to the register; these carriers had been residing temporarily out of the state.

Of the 35 carriers whose names were removed from the register, 23 died; six were released from restrictions after the submission of the required number of negative fecal and duodenal specimens following cholecystectomy; while the names of six others were removed because of change of residence of the carrier to a community outside the jurisdiction of the department.

Noteworthy is the fact that only 97 cases of typhoid fever were reported to have occurred in the upstate area during 1944. Since the best evidence indicates that an average of 3 per cent of cases of typhoid fever become chronic carriers, it is assumed that not more than three chronic carriers will develop from these cases. On the other hand, during the same period 23 carriers died. These data indicate the extent to which the typhoid problem is diminishing in New York State.

The Buffalo Gasolene Motor Co., Buffalo 13, N.Y., manufacturers of internal combustion engines, have just issued Bulletin No. 316, describing and illustrating several of their installations. The pamphlet in four colors stresses the point that gas and gasoline engines provide trustworthy standby power in flood protection works.

## Report by the Army

### Hexametaphosphate treatment has been used satisfactorily at ninety-two posts

The Army wants its hot water hot—180°F. minimum is specified for washing dishes. Heaters operating at the higher levels necessary to deliver water in the mess halls at this temperature naturally scaled up or corroded out at an extreme rate.

Post engineers seeking an answer to their mounting difficulties back in 1941 turned to Calgon\* for help. Simple and straightforward treatment with a few pounds of Calgon kept heaters on the line continuously for many months instead of a few days, cut down losses of critical equipment at a time when every pound of metal was precious.

Now the Army in a recent survey of its installations in this country, finds 92 posts where Calgon is relied upon to do at least one of the three jobs it does so effectively:

1. *Prevent scale*
2. *Prevent "red water"*
3. *Control corrosion*

Calgon pioneered these developments. Today, in war industry, as in Army camps, unadulterated Calgon made from food-grade phosphoric acid is doing an outstanding job in solving water problems.

*\*Calgon is the registered trade-mark of Calgon, Inc., for its glassy sodium phosphate products.*

The National Fire Protection Assn., 60 Battery-march St., Boston 10, has recently published a paper-covered, 96-page book entitled "Airplane Crash Fire Fighting Manual" at \$1.00 per copy. Accompanying descriptions of the technical details of how crashes occur and some of the causes is a discussion of fog and foam equipment.

To produce 1 lb. of butadiene, from which synthetic rubber is made, it is necessary to pump 1,200 lb. of water, to treat chemically 35 lb. of water for boiler use and to consume 20 lb. of steam. Morris Knowles, Inc., Cons. Engrs., Pittsburgh, was retained to make plans to fill these needs at Kobuta, a new synthetic rubber plant erected on the Ohio River 35 mi. from Pittsburgh by the Koppers United Co. The engineers designed a water plant which will withstand a flood stage 6 ft. higher than the crest reached in the disastrous flood of 1936. This means that the water would have to rise 32 ft. above the normal pool before pumping operations would have to be curtailed.

*(Continued from page 56)*

A new type of gasket, consisting of a felt base impregnated with a chromate-pigmented compound which renders the material flame- and fire-resistant as well as corrosion-resistant, has been announced by the Sherwin-Williams Co. Originally intended as a substitute for low-pressure rubber gaskets required in marine ventilating systems, chromate gasketing has since demonstrated its usefulness in many other applications, including joint seals in water, fuel oil and diesel oil systems as well as gasketing for air lock and refrigerator doors.

The Industrial Chemical Sales Div. of the West Virginia Pulp & Paper Co., has developed a lignin from pine wood which it calls "Indulin." Industrial Chemical Sales has available a descriptive bulletin which includes a very complete bibliography on the subject of the uses of lignin, including water treatment applications.

The introduction to the pamphlet, Bulletin L-1, states that:

*(Continued on page 60)*

## A MESSAGE TO WATER WORKS OFFICIALS...

No peacetime industry has escaped the consequences of total war. Dislocations, restrictions, emergency regulations, shortages in labor and supplies, etc., have hampered operations for all, some suffering more severely than others.

As a result of war contingencies during these past few years which have been so hectic, the American Norit Co., Inc., has been forced to severely curtail its production of water carbons. With the cessation of hostilities in Europe, it is hoped that full scale production can be resumed, enabling us to meet all demands for NORIT with the same promptness as before the war.

A NEW BULLETIN  
OF TIMELY IMPORTANCE

For  
**ENGINEERS,  
SUPERINTENDENTS,  
OPERATORS**

Just off the press, this entirely rewritten edition of our popular bulletin "Measurement, Control and Chemical Treatment of Sewage and Sludge" has been prepared for engineers and others engaged on sewage treatment problems for both large and small communities. It contains many pages of interesting and valuable information . . . fully illustrated . . . describes new types of indicating, recording and integrating flow instruments devised by Builders engineers for connection to such primary units as Venturi Tubes, Orifices, Kennison Nozzles, Parshall Flumes and Conveyor Scales. Useful reference diagrams are also included. Write today for your copy of Bulletin 287A. Address Builders-Providence, Inc. (Division of Builders Iron Foundry), 25 Codding St., Providence 1, R. I.

*Sincerely*  
**BUILDERS-PROVIDENCE**

(Continued from page 58)

Indulin is a lignin derived from pine wood by processes associated with a large sulfate paper pulp mill.

Indulin of two types is now available from an experimental plant capable of supplying quantities for experimental evaluations.

Indulin is produced by processes that are standardized to assure close specifications in properties.

Type C is a disodium salt of Type A.

Indulin C and Indulin A are brown, free flowing, amorphous powders of small-particle size which can be shipped in paper, wood or metal containers.

"X-Ray Diffraction—An Industrial Tool," is a 4-page booklet recently issued by the North American Philips Co., Inc., 100 East 42nd St., New York 17, N.Y. It explains the technic employed in Norelco film-type X-ray equipment for identification of materials.

Water works applications claimed for X-ray diffraction are: (1) Determination of covering quality of paint pigments; (2) Metallic deposition in formation of metallic carbides; and (3) Determination of character of metallic films.

has stood for Quality. Our founder always insisted RENSSELAER Valves and Hydrants must be the best possible to produce. This same policy has been faithfully followed down to the present day. Ask the man who uses RENSSELAER.

**RENSSELAER VALVE CO., TROY, N. Y.**

## NEWS OF THE FIELD

**Section officers** are responding to the opportunity to develop new types of meetings of their members so that the limits of the O.D.T. Committee on Conventions are not exceeded. The regional meetings recently held by the New York, Kentucky and Indiana members were eye-openers to everyone who participated.

The New York Section meetings covered four successive sessions of one day each in Rochester, Syracuse, Albany and White Plains. The report by Secretary Blanchard appears elsewhere in this issue and shows that the attendance of operating water works men was unprecedented and the interest was high. They were real meetings of minds.

The Kentucky members of the Kentucky-Tennessee Section held a two-day session in Kentucky University halls at Lexington. No prepared papers were read. Instead there were panels of five men each to lead the discussions. Here again the members present were in no way backward. Within thirty minutes after the first session opened, the discussion was just as active from the floor as from the panel. The subjects were: Distribution Problems, Pumping Station Problems and Water Purification Problems. The value that every person present derived from the meetings was evidence of the capacity of water works men to ask intelligent questions and get to the heart of their problems.

The Indiana Section has held a series of regional one-day meetings each autumn for nearly ten years and knows how to handle sessions at the grass-roots level. In the face of inability to hold the regular Section meeting this spring, a series of eight one-day meetings were held in mid-June. Here the program followed a regular pattern—a series of short papers each morning and free discussion of set topics each afternoon. Combined with these meetings were the ceremonies at which the John N. Hurty awards were presented. An account of these awards appears below.

The lessons derived from the three Sections clearly indicate that effective meetings of water works men can be held under present restricted conditions. The Four States and Minnesota Sections are planning to carry out the same idea. More power to them!

**Joseph L. Quinn**, Acting Director of the Div. of Environmental Sanitation, Indiana State Board of Health, has devised a special service award with which the board is annually honoring all employees of water

*(Continued on page 2)*

(Continued from page 1)

works in the state who have served their organizations for 25 years. The award is known as the John N. Hurty Service Award, in honor of the founder of the Indiana Section of the A.W.W.A., and an illustrious crusader and apostle of public health in the Hoosier State. There is a scroll citation, signed by the governor of the state and the director of the board of health, and, when governmental restrictions are lifted, there will be a silver lapel button.

Quinn's main objective when he conceived this award was to attract public attention to these faithful servants whose work is often neither understood nor appreciated by the lay public. The awards for 1945 were presented in person at the Indiana Section's District Meetings in June, and an effort was made to have write-ups and pictures in all of the local papers, thus providing an opportunity to publicize histories of the water works and of the individuals, and to describe the present operations of water works plants.

First recipients of the award devised by Quinn included all those water works men in Indiana who have been engaged in their work for 25 years or more. Among them were four men who have been in it for 50 years or more, the oldest of these being B. Youree of the Indianapolis Water Co., who began swinging a shovel for that company in 1890 and is still doing so. At Richmond, Ind., three recipients were the Chief Engr., William Armbruster, who entered the city's employ in 1913, and his two brothers, Andrew Armbruster, Asst. Engr., who began in 1917, and Carl Armbruster, Engr., who started in 1919. Two men fell in the 45-49-year group, ten in the 40-44-year group, 27 in the 35-39-year group, 36 in the 30-34-year group and 66 in the 25-29-year group.

**George Tilley Seabury**, Executive Secretary, American Society of Civil Engineers, died in New York on May 25 of coronary thrombosis.

Born in Newport, R.I., 65 years ago, Mr. Seabury was graduated from the Massachusetts Institute of Technology in 1902. After a short period in the heavy engineering construction field, he spent ten years with the New York Board of Water Supply, working on the Ashokan Reservoir and Dam, and later on the Kensico Reservoir and Dam. In 1915 he was appointed division engineer in charge of \$18,000,000 worth of construction for the new water supply system in Providence, R.I.

During World War I, Mr. Seabury served as a major in the Army Quartermaster Corps, doing construction work at camp sites in this country. In the early twenties he was engaged in private practice in New England, and, on Jan. 1, 1925, took office as Secretary of the A.S.C.E. Since that time, membership in the society has almost doubled. Mr. Seabury founded the journal *Civil Engineering* for the society in 1930.

**Milford E. Rogers**, former Engr. and Supt., Wichita, Kan., Water System, is now Project Engr. with Builders-Providence, Inc., Div. of Builders Iron Fdry., Providence, R.I.

Rogers will be engaged in sales and service in connection with design and manufacture of flowmeter, flow control and related equipment for water and sewage works. A native of St. Louis, Mo., Rogers received a B.S. in Civ. Engr. from Kansas Univ. Before entering the water works field in 1937, he was engaged in design, maintenance and construction for the Santa Fe Railway.

**Homer G. Turner**, Research Engineer at State College, Pa., for the Anthracite Equipment Corp. of New York, died of a heart attack on May 17 in Erie, while there on a business trip.

Mr. Turner was born in Toronto in 1887 and educated at Syracuse and Chicago universities. Before becoming Director of Research for the Anthracite Equipment Corp. in 1930, he had taught geology and mineralogy, first at Syracuse and then at Lehigh University. In 1927, he commenced his work in the anthracite research field and developed its potentialities as a filter medium. Thereafter he became affiliated with the Anthracite Equipment Corp. and engaged in a continuing study of "Anthrafilt." He published a number of technical treatises on anthracite, its geology, physical properties, chemical properties and non-fuel uses. An article by him dealing with "Anthrafilt" appeared in the April 1944 JOURNAL.

325 W. 25th PLACE, CHICAGO 16, ILL.

*(Continued from page 18)*

Mass prevention of man's most common disease, tooth decay, merely by drinking fluorinated water was predicted by dental leaders at a recent meeting of the New York Institute of Clinical Oral Pathology. Dr. William J. Gies, Past Pres. of the American College of Dentists, Dr. Arthur Merritt, Past Pres. of the American Dental Assn., and Dr. David B. Ast, Dental Director of the New York State Dept. of Health, forecast this utopia as a result of experiments being conducted by the State Dept. of Health at Newburgh and Kingston, N. Y.

Toasting the success of the research project at Newburgh with fluorinated water especially sent down for the occasion, Dr. Gies said that "by the addition of physiological proportions of sodium fluoride to communal water supplies" tooth decay can be controlled without inducing toxic effects elsewhere in the body.

"It has been discovered," said Dr. Gies, "that fluorine has cut down the incidence of dental cavities in those sections of the country where it is found in the drinking water."

"In June 1944," said Dr. Ast, who reported on fluorination in the September 1943 JOURNAL, "systematic fluorination tests were begun at Newburgh and Kingston. The research project will continue for a

Among products that have been proved by many years of experience, cast iron pipe is in the highest rank. Consider its truly remarkable record.

Cast iron water mains were pioneered in America 120 years ago. Today, in 200 out of 212 of our largest cities, some or all of the original cast iron mains are still in service, in many instances after more than a century. In the 15 largest cities, more than 95% of the pipe in the water distribution systems is cast iron pipe. In the three largest cities—New York, Chicago, Philadelphia—the ratios are, respectively, 97%, 99% and 98%. Thus it is evident that topflight engineers *continue* to endorse the judgment of four generations of water works men.

Confidence, based on experience, is doubly important in the case of pipe to be installed underground for distribution mains. They represent the major investment in a water supply system. So we say—*trust the pipe you know about.*

period of from ten to twelve years at a yearly cost of approximately \$25,000. These two cities, each with a population of about 30,000 and possessing comparable water supplies, population groups, climatic conditions, economic status, and common sources of food supply, have agreed to serve as demonstration and control areas.

"Newburgh, as the study area, will have its potable water supply treated with sodium fluoride. Kingston, where the water supply is fluorine-free, will continue to use its natural water supply and will serve as a control.

"All five- to twelve-year-old children in the schools of Newburgh and Kingston will be examined annually for dental-caries experience. To date available data indicate that the benefits derived from ingested-fluorine water accrue during the years of tooth development, that is, through age eight. After the teeth have calcified, fluorine drunk in water is apparently not effective. Adult examinations will determine the effects of fluorine in small concentrations on persons past 50 years.

"There is every reason to believe," Dr. Ast concluded, "that artificially fluorinated water will produce the same results in kind and degree that are caused by waters in which fluorine is found naturally."

# LANDMARKS

Here a Ludlow List 75 Ludlow Slide Gate Hydrant, installed many years ago, still serves dependably, its good design truly at home amid the modern stores and apartments of suburban Boston.

This Ludlow List 90 Slide Gate Hydrant is of recent design, and is set farther back from the curb, in accordance with modern practice. This current model offers many desirable features worth investigating.

## IN HISTORIC BROOKLINE, MASSACHUSETTS LUDLOW HYDRANTS TAKE THEIR TRADITIONAL PLACE IN THE AMERICAN SCENE

**YEAR** in and year out, Ludlow Hydrants serve on, although installation practice may change, and architectural treatments may vary. The List 90 Slide Gate model is now a general favorite the country over. It insures quick water, proper shut-off without water hammer, correct drainage and easy inspection and servicing. Full information, specifications and costs await your request.

## how to give water a BATH!

Even sparkling, clean-looking water needs a thorough "going over" . . . for like a germ-infested jungle stream, it can be the carrier of deadly water-borne germs . . . It can tumble forth the wastes and impurities of industrial plants.

To make water **safe**, both on home and battle fronts, engineers rely on versatile Solvay Liquid Chlorine. This liquid effectively gives water a **bath**—"washing" out impurities, foul tastes and odors.

Today Solvay Liquid Chlorine is serving on two fronts. Tomorrow it will serve municipalities and industry with newly discovered uses.

### **WATER SYSTEMS MUST BE EXPANDED**

The growth of cities and towns will ever continue. For every thousand increase in population, there will be a need for more water.

Water Systems must keep a step ahead of the need. They should be of the finest quality and highest efficiency. Furthermore repair and maintenance service must always be obtainable.

For absolute dependability, you will choose Layne Systems. They have scores of years of proven service with hundreds of municipalities, industries, war camps and ship yards. Their records of long life and low upkeep cost have never been equaled.

Right now Layne is offering the co-operation of their engineers on postwar planning. If you are facing an increased water supply problem, write for details, literature etc.

## Steel pipe in water works service

Small-diameter steel pipe, lined and coated at the pipe mills, is specified by engineers because of the successful experience in the speed and ease of installation.

Barrett Coal-tar Enamel provides a smooth, mirror-like coating that reduces surface friction and maintains peak capacity operation. For many years to come, its superior resistance to water absorption and electrolytic corrosion answers all requirements for heavy duty, and meets American Water Works Association's standard specifications 7A.5-7A.6-1940.

## EUROPEAN LIBRARIES DEPLETED

### Back Numbers Needed to Complete Journal Volumes for War Years

There is now a large demand for complete volumes of the JOURNAL, for the years 1939-1944, not only to replace literature destroyed by the war, but also to supply scientific information that has been unobtainable for six years. However, the issues listed below are in short supply, and the Association appeals to you to sell back to the headquarters office these numbers of the JOURNAL which are needed to make up complete volumes for overseas libraries. You will be paid \$.50 per copy for doing your part. Send the following JOURNALS immediately to the American Water Works Association, Inc., 500 Fifth Ave., New York 18, N. Y., and they will be acknowledged by a check in payment.

Vol. 31, No. 1	Vol. 33, No. 1
2	2
3	7
4	9
5	12
6	
8	Vol. 34, No. 1
Vol. 32, No. 1	Vol. 35, No. 1
2	
3	Vol. 36, No. 3

#### Complete Volumes

The Association will also be glad to hear from any member who has complete volumes of the JOURNAL of any year. His willingness to sell will be recorded and when a prospective purchaser applies to the Association for complete volumes, he will be put in touch with the member who has volumes to sell. Shipment may then be made directly to the purchaser. The Association's headquarters office does not have room to store complete volumes, thus making this method of transaction necessary.

# You'll profit with this STEEL PIPE for your new lines

Now that you are planning those war-postponed improvements for your waterworks systems, it will pay you to consider the many practical advantages of ARMCO Spiral Welded Steel Pipe.

When your waterworks system is designed to take full advantage of the features of ARMCO Steel Pipe, you can be sure of economical and efficient operation.

ARMCO Steel Pipe is easy to install and skilled labor is unnecessary. Fifty-foot lengths mean fewer joints, less assembly work. A spun-enamel lining assures high flow capacity, prevents tuberculation and

recurrent cleaning troubles. Shattering or sudden breaks are no worry with "Spiral Welded." Sizes range from 6" to 36", with wall thicknesses to meet requirements.

See for yourself how you can save time and money by putting these advantages to work. For information about ARMCO Steel Pipe, just address Armco Drainage & Metal Products, Inc., Welded Pipe Sales Division, 2411 Curtis Street, Middletown, Ohio.

EXPORT: THE ARMCO INTERNATIONAL CORP.

MEETS A.W.W.A. STANDARD SPECIFICATIONS

*(Continued from page 24)*

### NEW YORK SECTION REGIONAL MEETINGS

In accordance with the directive issued by the A.W.W.A. Board of Directors after their meeting in January, the New York Section replaced its Spring Section Meeting with several "regional" meetings which made minimum demands on transportation and hotel facilities. The meetings, which were held within the space of four days, repeated the same program each morning and localized topics were discussed in the afternoons. In order to send everyone home at nightfall, instead of keeping them in the cities overnight, the meetings were terminated by 5:00 o'clock.

The uniform morning schedule included: "The Mutual Aid Program," by Earl Devendorf, Asst. Director, Div. of Sanitation, New York State Dept. of Health; "Manpower Savings in Water Works Operation," by Samuel F. Newkirk Jr., Pres., A.W.W.A.; "Water Works Materials From the War Production Viewpoint," by Bayard F. Snow, Dist. Engr., Water Div., OWU, Washington, D.C.; and "Wartime Maintenance Problems," by Hugh S. Dewey, Pres., Western New York Water Co., Buffalo.

Rochester's meeting, held on May 22 at the Hotel Powers, offered afternoon speeches on "Reconditioning a 70-Year-Old Abandoned Water Main," by Lewis B. Smith, Supt., Water Div., Rochester; and a round table discussion led by William H. Clark, Supt., Avon, N.Y., Water Works.

At the Syracuse meeting, held at the Hotel Onondaga on May 23, the conferees heard A. A. Korves, Local Mgr. of the Syracuse Plant, New York Water Service Corp., speak on "Meeting Wartime Demands in Suburban Syracuse." Elon P. Stewart, Engr., Div. of Water Supply, Syracuse, led the round table discussion.

In Albany at the Hotel DeWitt Clinton on May 24, Ernest L. H. Meyer, Supt. of the Glens Falls Board of Water Comrs., spoke on "System Maintenance." The round table was under the guidance of William Luby of Troy.

*(Continued on page 44)*

### TO EARN FULL WATER WORKS REVENUE—

use Buffalo-made service water meters. Select the bronze case American model or galvanized iron case Niagara model, according to water properties. Extra-thick measuring disc compels extra accuracy. Write for details of many exclusive profitable features.

**ASBESTOS IN ACTION**

BUILT TO  
WITHSTAND  
VIBRATION

**K&M**  
"Century"  
ASBESTOS-  
CEMENT  
PIPE

Closeup view of the "Century" coupling. Its flexibility is an invaluable asset not only in conditions of this kind, but also where it is necessary to make sharp angled curves in a "Century" Pipe line, without using elbows or bends.

Even as trains roar by overhead, vibrations have no effect on this "Century" Asbestos-cement Pipe line. Not only is the pipe itself extremely strong and durable, but the "Century" flexible couplings provide a generous factor of safety at each joint. It is this ability to withstand the toughest kind of conditions that accounts for "Century" Pipe's wide acceptance among the men who know.

At the same time, "Century" Asbestos-cement Pipe is economical. Its light weight makes for quick installation and easy handling . . . even with inexperienced crews. It is not subject to tuberculation, corrosion or electrolysis, thus assuring long life and minimum maintenance over the years.

Nature made Asbestos . . . Keasbey & Mattison has made it serve mankind since 1873. . . . Today K&M "Century" Asbestos-cement Pipe is a source of continued satisfaction and good will in the community. It is wise to install it. There is plenty available for immediate shipment.

*(Continued from page 42)*

R. M. Leggette, Cons. Ground Water Geologist, New York City, spoke on "Artificial Recharge of Ground Water" at the White Plains meeting, held in the Westchester County Bldg. on May 25. Tobias Hochlerner, Chief Engr., New York City Dept. of Water Supply, Gas & Electricity, described the distribution of water to outside communities from the New York City supply. James C. Harding, Comr. of the White Plains Public Works, was in charge of the round table discussion.

A total of 400 water works operators attended the four meetings. A large number of these were not A.W.W.A. members, but were individuals engaged in the water works industry and invited to the meetings by the Membership Committee.

Election of officers was postponed until such time as a regular section meeting may be held upon relaxation of the ODT ruling banning conventions which might draw more than 50 persons from outside a local area. The regular luncheon meeting in New York City at the time of the Annual Directors' Meeting in January 1946 has been scheduled, however.

*For Tight, Flexible Joints Across  
Streams and Waterways Use*

### MOLOX BALL-AND-SOCKET PIPE

Where gas, oil, water and other liquids must be conveyed across streams, bays, swamps and sloughs unstable trench conditions make imperative the use of a pipe with flexible joints that remain bottle tight.

Such is Molox Ball-and-Socket Pipe, manufactured by the Mono-Cast centrifugal method. The Molox Ball-and-Socket Joint permits assembly on a barge, or the pipe may be assembled at the shore line and floated across on pontoons. The extreme flexibility of the joint permits a deflection of 15° so the pipe may be slid from the barge or released from pontoons without fear of leaks developing in the joints.

# THIS PROTECTION

## *Pays for itself . . .*

BUFFALO ENGINES

*Lake Kilby Pumping Station, City of Portsmouth, Va.  
Two—ATT-8 Buffalo Gasoline Engines.*

To omit stand-by engine and pumping equipment invites trouble. When regular power service fails, the best to be hoped for is a flood of complaints from customers, taxpayers, or voters—and the worst is the risk of serious fire or epidemic.

The assurance of protection given by a BUFFALO stand-by motor generator or pumping set is well worth its cost—and the cost itself is returned to the community or user in lower insurance premiums.

Applied to a BUFFALO ENGINE installation, "assurance of protection" is no idle phrase. Years of special experience in

building heavy-duty motors for this service have resulted in designs that have proven this assurance in thousands of important installations.

You can select a BUFFALO ENGINE that starts either manually, by remote control, or fully automatic—that reaches its full load in 30 seconds and runs at absolutely constant speed, delivering its power cleanly, quietly and without vibration.

Write for Specification Sheets for your files or information on any type of application that interests you.

In the pages of "The Way Our People Lived,"\* W. E. Woodward, the historian, paints America's background by visualizing a few days or a few weeks in the lives of typical Americans in typical years since 1610. In these pages may be found the broken threads of a story of water supply in America. For instance, we read that in Boston, 300 years ago, there might have been a carpenter and cabinetmaker named Doolittle:

One of the products of his shop was called a "cistern." It looked like our modern water cooler, though it had no tap or faucet, and sometimes it was actually used to keep a supply of water, but its ordinary purpose was to hold beer or cider, which were customary household beverages. Water was regarded with deep suspicion, both in England and the colonies, and probably with just reason. Our forefathers knew nothing of sanitation in the modern sense, and the water of wells and springs must have been swarming with germs. Beer and cider were given even to small children with their meals—and between meals whenever they were thirsty. Nevertheless water, as a beverage, was being tried out timidly during the early Puritan period. The Reverend Mr. Higginson, a minister of the time, wrote, "Whereas my stomach could only digest and did

## DOWN BELOW LEAD SERVICES RATE HIGH

**L** EAD pipe's flexibility prevents damage by ground movement or settlement and eliminates many joints. Thick walls of corrosion-resistant lead result in great durability and freedom from clogging.

That's why wise engineers reduce long-term costs by using lead services. Lead's additional first cost is infinitesimal when all the costs of installing any kind of service — paving, trenching, backfilling and so on — are considered.

Insist on lead pipe and calking lead meeting recognized national standards such as Federal Specification WW-P-325, Lead Industries Association Standards, or CS94-41 and CS95-41 of the National Bureau of Standards. Such lead products may be identified by this Seal stamped on them for your protection. Write us for copies of these standards and specifications and for our free magazine, "Lead."

### Why they keep calling for calking lead:

1. *Flexible joints take up ground movement without damage to pipe or joints.*
2. *Quickly repaired by simple re-calking without interruption to flow.*
3. *Generations of proved performance.*
4. *No close temperature control needed.*

require such drink as was both strong and stale, I can and oftimes do drink New England water very well." There was a rumor that Governor Winthrop drank water daily and by preference but the rumor was not generally believed.

Many cisterns came from Doolittle's shop, and some of them were expensive because of the carving on them and their silver hoops. [P. 26.]

In a Puritan community of 1680, we find that the demon Rum had not yet been ferreted out:

There were no bathrooms in the house, but they were not missed, for no one in that era ever took a bath. The fanciful medical lore of the seventeenth century ascribed many human ailments to contact with water. Consequently, washing with water was limited to the hands and face. As was mentioned before, this prejudice extended to the drinking of water, and people in general avoided water as a beverage. On hot summer days even the farm hands, perspiring at their work in the fields, drank cider instead of water. Babies were given beer and cider as soon as they were old enough to toddle. [P. 40.]

New Yorkers in 1750 were apparently not so antipathetic to drinking water as their neighbors to the north, as may be seen in this excerpt from

a description of a house on the corner of William and Wall Streets, occupied by a family named Lawrence.

Water for drinking and washing was brought to the Lawrence house in casks by a contractor who made a monthly charge for this service. Many Manhattan families had wells on their premises, but there was none on the Lawrence place, for when they had gone down 40 ft. the well diggers had struck solid rock instead of water. [P. 106.]

In 1836, Woodward hypothesizes, one Susan Pettigrew might have journeyed from Westchester County, N.Y., to Cincinnati to see her married daughter. En route she stopped in New York City, where she saw "walk-up" apartments.

Water . . . had to be carried up in pails, after being drawn from wells in the street. Owing to the engineering difficulties that arose from its situation on an island New York did not acquire a municipal water system until October 1842, when the Croton water supply came into being. Croton water was brought into the city in large pipes made of hollowed logs, which were supplanted several years later by tubes of iron. [P. 211.]

# PROPERLY REFINED WATER

- for Your Homes
- Your Industries
- Your Institutions

Cities and towns prosper and grow, or become decadent, depending upon the prosperity of their business and industry, and the happiness of their citizens. In thousands of American communities, *properly* refined water has made the difference. But refined or treated water is not enough. It must be **PROPERLY** refined! Refinite methods are backed by over a quarter of a century of research, engineering, and manufacturing of refining equipment for municipalities, institutions, and industrial plants the nation over. Each installation is individually designed to *properly* refine the problem water . . . to give maximum economy. If you have a water problem, consult Refinite now.

## The Refinite Corporation

108 Refinite Building

*(Continued from page 50)*

Susan Pettigrew's next stop, Philadelphia, brought her to a "modern" hotel in which she lodged in a room of her own where she could retire without fear of awaking to find one or more other "females" sharing her bed. Until very recently it had been customary for "hotels" to provide bed-space, not rooms.

The room had running water and a tidy built-in wash basin, but no bathroom. Susan had often heard of houses with pipes of water in them that one could turn on and off, but there were none in New York. Before she went to bed that night she spent a quarter of an hour playing with the faucets and the stream of water just to see how quickly it would start to run and how big a stream came from it. It started slowly and the stream was small. [P. 220.]

In Cincinnati, Susan found her daughter living in luxury.

Upstairs there were five bedrooms and two baths with running water. Caroline turned on the water a moment to show how the bath worked. She said that when warm water was needed it had to be brought upstairs by Julia, but the ordinary cold water was always on tap. The bathtubs were of sheet metal encased in wood. [P. 232.]

Woodward goes on to explain that:

(Continued from page 52)

Nobody really knows the history of bathtubs, but tubs made of light metal—probably tin—and shaped like the modern bathroom fixture were in use long before houses were equipped for running water. When pipes were put in dwelling houses it was, no doubt, a simple matter to set up a bathtub with a pipe and a faucet, and tubs of this modern type probably appeared in various localities at approximately the same time. There were many in use in the later 1820's.

The hurricane experience articles in the June JOURNAL bring to mind the following story which Bennett Cerf tells in his *Try and Stop Me*: \*

Do you remember the New England hurricane of 1938?

A commuter who lived in Stamford had always wanted to own a barometer. Two days before the big blow he finally bought one at Abercrombie & Fitch. [When] he tacked it up on his wall, [he] read it, and exploded with anger. There was no phone in his house, so he walked a mile to the nearest drugstore and called up Abercrombie. "Fine barometer you sold me," he snorted. "I put it up in my Stamford house and what do you think it registers? Hurricane!"

"Return it," soothed the clerk. "We'll replace it with a perfect one."

He went back to fetch the barometer but, by the time he got there, his house had been blown away.

*(Continued from page 56)*

"**Cast Iron Pipe News**," published by the Cast Iron Pipe Research Association, recently carried the following letter from Col. Ethelred L. Sykes:

"When G.I. Joe goes overseas and reaches the forward areas, he has forcibly impressed on him how great a luxury is a plentiful supply of pure water always on tap. The Army Engineers do a magnificent water supply job, but G.I. Joe 'totes his own.' His wash basin is his steel helmet; his canteen holds his drinking water. He quickly learns to conserve water, and he is forcibly taught the dangers of impure water, which he must avoid or fall prey to dysentery.

"At many Pacific stations, where rainfall is heavy and frequent, you see many tents with a homemade water works consisting of about 8 ft. of gutter pressed against the tent-side, and draining into a large drinking water drum. A few chlorine tablets, or a spot of iodine, makes this rain water quite safe and palatable, even if it does run off a tent side or roof. By elevating the drum, it's frequently possible to tap it off for shower and shaving purposes. The tent I'm living in just now is located on the edge of a 60-ft. cliff, so our drum furnishes us drinking water and a gravity flow line to a lower level of the cliff, where our shower is installed. Far below is the ocean, with a fine swimming place within two minutes walk.

"When the Army is demobilized, millions of boys are going to return home very 'water conscious.' They will be voters who should be supporters of water works and sewage disposal improvements, because they know what it means to do without them."

## NEWS OF THE FIELD

This country is now moving from the close controls at the 1942-43 height of the war construction program toward complete relaxation of limitations and the abandonment of WPB allocations of material. Mind you, the word is "moving"! We are not there yet—but the journey has started.

Just as the men in the army always have and always will grouse over the food, so the American people—industry, labor, trade—and water works men, too—have chafed over the restrictions that the military production program has placed upon them. They have longed for the days—which they do not remember too clearly—when the salesman called and did some "selling." They think they remember that the things ordered were always waiting just around the corner. It is just as well for us to get our mental feet on the ground in respect to that matter. We did have to do some waiting for many things, notably large specially-built equipment, before the war. We are going to do some waiting when the controls are taken off.

The WPB has announced that it expects to discontinue priorities assistance for virtually everything except military requirements by the end of 1945. It proposes to assure itself that war-supporting and essential civilian production needs no help before it is turned loose. This is not so simple as it sounds. Just as it was difficult for us—both manufacturers and consumers in the water works field—to adjust ourselves to the restrictions of P-46 (now U-1) and the various limitation orders, so we are going to find it difficult to produce or to get equipment and materials as the control of supplies is taken away and the competition for materials gets going.

Today Order U-1 is only a skeleton of its former self so far as limitations go. In simple number terms, the great majority of water works can use the AA-1 or AA-3 rating under the terms of U-1 to replace all the equipment and to build all the plant that they conceivably need today. Only buildings costing over \$25,000 are under control.

But we forget that the rating system that we have had, either under U-1 or on approved 2,774 orders, did confer a *priority*. The water works industry and other essential activities stood well up in the line when it was time to get materials.

(Continued on page 2)

(Continued from page 1)

When the WPB terminates priorities assistance (and it has been assistance) water works operators will take their place at the counter beside the clamoring manufacturers and users of "consumer goods," such as washing machines, refrigerators, etc. We are not going to like the return to a so-called free market, even though we have groused because it has not been free during the war.

All this means that water works managers must work with their manufacturers understandingly. Manufacturers must be patient with water works managers. Orders must be placed on a considered schedule basis. Every plant that piles up inventory in its stock room will keep its neighbor from getting an equitable share of 1945 or 1946 goods. The manufacturer's agent who grabs a *big* order from one water works, kids himself and hurts his other customers.

The inflationary boom that threatens us will grow on a foundation of greedy producers and gluttonous buyers. The safest way to avoid inflation is to keep our buying and selling balance. WPB restrictions and allocations have imposed that balance upon us. Have we fortitude enough to work and produce without these restrictions?

## KLETT SUMMERSON ELECTRIC PHOTOMETER

*Adaptable for Use in Water  
Analysis*

Can be used for any determination in which color or turbidity can be developed in proportion to substance to be determined

---

**KLETT MANUFACTURING CO.**  
179 EAST 87th STREET • NEW YORK, N. Y.

## ARE GREMLINS AT WORK?

**C**orrosion and tuberculation are the saboteurs to guard against in your water mains. Unchecked—these agents of time and wear can cause irreparable damage. So play safe and give those water supply lines a protective lining of thin, dense cement mortar. Applied in place speedily and economically the Centrline way, this sleek new lining will provide a non-corrosive non-tuberculating surface, shielding the underlying metal (whether steel or cast iron), assuring a permanently high coefficient and increased longevity.

Wherever your pipeline is situated, whatever its length—if its diameter is 30" or more—our men can quickly reach and recondition it. Hurry . . . don't let the Gremlins get there first.

### CENTRILINE CORPORATION

142 Cedar Street • New York 6, N. Y.

*The Centrline process is a rapid and economical method of reconditioning pipe lines. It consists of first cleaning the main and then applying, by centrifugal force, a dense cement mortar lining of required thickness, mechanically troweled to a smooth finish. This is done underground, in place.*

**Restores and Protects Pipe-Line Carrying Capacity**

*(Continued from page 2)*

**Maurice N. Gerardy**, Senior Associate Civil Engineer of Hydraulics, in charge of hydraulic and water waste surveys for the Department of Water Supply, Detroit, Mich., died after a six-months' illness on June 12.

Born near Detroit in 1896, Mr. Gerardy began his engineering career as Instrumentman with the Detroit United Railways, and a few years later became Party Chief for P. M. Lau, Consulting Engineer in Pontiac, Mich. During the First World War he served in France with a volunteer engineers unit, and then returned to the job of Chief of Party for Mason L. Brown, Consulting Engineer, Detroit, which he had held at the time of his enlistment.

In 1920, Mr. Gerardy became a Pitometer engineer for the Pitometer Co. of New York City, which at that time was carrying on a water waste survey in Detroit. He transferred to the Detroit Department of Water Supply in 1922 and, as an engineer of hydraulics, had a major part in planning the growth of the distribution system from 1,647 miles to 5,042 miles of water mains. During this period the assets of the department increased from \$64,500,000 in 1922 to \$152,209,000 in 1945.

He was an original Trustee of the City of Detroit Retirement System, appointed in 1937, six months prior to its effective date for organization purposes, and continued to serve as Trustee after the system was in operation.

A member of the A.W.W.A. since 1922, Mr. Gerardy was active in the organization of the Michigan Section, of which he was the first Secretary-Treasurer, and which office he held until the time of his death.

**Wallace T. Miller**, Supt., Ossining, N.Y., Board of Water Comrs., and formerly chairman of the New York Section, A.W.W.A., has been in service as Lieutenant, CEC, USNR, and in July was ordered to duty in the Pacific Theatre.

**Allan H. Rogers**, City Engr. and Supt. of Public Works, Garden City, N.Y., and Chairman of the New York Section, A.W.W.A., has taken a six-month leave-of-absence to serve as a consultant to the Office of Chief of Engineers, Army Engineer Corps. He is attached to the First Service Command, and is working on a program for the reorganization of refuse collection.

## New-design equipment for removing water hardness...

### PERMUTIT Spaulding Precipitator

**Cuts detention time, saves chemicals,  
takes only 1/2 the space of former methods**

**PERMUTIT SPAULDING PRECIPITATOR** removes water hardness, dirt and color by the sludge blanket process. This new-design equipment cuts detention time, saves chemicals, takes only half the space of former methods. Present installations handle up to 120,000,000 gallons daily.

It removes water hardness, dirt and color by the sludge blanket process, cutting detention time and saving chemicals. It requires only half the space of former methods. No wonder engineers, in blueprinting their water improvement plans, specify the Permutit\* Spaulding Precipitator.

If *your* postwar program includes water conditioning—and it should—write for details of this modern, efficient equipment. Address The Permutit Co., Dept. G2, 330 West 42nd Street, New York 18, N. Y. or Permutit Co. of Canada, Ltd., Montreal.

\*Trademark Reg. U. S. Pat. Off.

# PERMUTIT

WATER CONDITIONING HEADQUARTERS

(Continued from page 4)

The Nicholas S. Hill Cup has been awarded for the year 1944-45 to the Missouri Valley Section. This cup has been awarded annually since 1916 to the Section making the largest gain in membership since the previous convention of the A.W.W.A. It was awarded to the Florida Section at the Milwaukee Convention of 1944. Because there has been no 1945 convention, the A.W.W.A. Executive Committee directed that the award for the year be made on the basis of membership totals as of July 1, 1945.

Since 1941 the award has been based upon the recommendations of a special committee headed by Wendell R. LaDue, now Vice-President of the A.W.W.A. A formula for computing the award was established as follows:

The number of points earned will be based on the net annual increase in the paid-up membership at the time of the convention, said points being the result of the following:

- (a) 1 point for each 1 per cent of quota gained, plus
- (b) 1 point for each 10 members gained.

This weighing of points, while arbitrary, is believed to be equitable.

As the committee stated at the time, it is assumed that it takes more effort to get a new member in a small Section than in a large Section.

(Continued on page 8)

## Prevent Rusting

Rusta Restor cathodic protection, provides permanent protection against rusting of water tanks, piping and steel structures of all kinds.

Initial cost of a complete equipment is about equal to the cost of a good paint job. . . . Operation costs only about 2 mills (i. e. \$0.002) per year per square foot of surface protected.

If your tanks and steel structures are not now protected by this proven low cost method, they should be. No obligation. Send for fully descriptive literature today.

(Continued from page 6)

A letter from Lt. Col. Lloyd K. Clark, Sn.C., to Col. W. A. Hardenberg, Director, San. Eng. Div., Surgeon General's Office, appeared in the June *Bulletin of the U.S. Army Medical Dept.* Colonel Clark is working on the Metropolitan Water District in Manila, and had the following tale to tell:

I just wanted to drop you a line to let you know how we're doing here. I'm assigned to the Engineers to assist in rehabilitating a large water and sewer system. Got here on 6 February, have worked all night and day—several times—and have been shot at with everything from 5-inch to sniper fire. I got out to the filter plant the day after it was captured. The taking of the plant and appurtenances took place at 7:00 p.m. It was scheduled to be blown at 7:30—what luck! They took out 1,500 lb. TNT. Shellfire damaged one pump and switch panel. They blew the aqueduct in three places, four main line gate valves, part of a covered reservoir. With all bridges blown in the city, the whole south side is shut off, but we've got an old siphon we're putting back into service—they missed that.

There is much damage to service connections due to widespread fires and shelling. Few large buildings are standing. The water went out of the system entirely on 9 February. We had continuous pressure back in the north side on 24 February. My job is to get the Metropolitan Water District on its feet

## Many Field Bends and "Specials" Eliminated with Dressers

Because Dresser Couplings permit approximately 4 degrees of deflection from pipe section to pipe section (from  $10^\circ$  for small diameter pipe to  $\frac{1}{2}^\circ$  for very large diameter pipe), it is possible to build moderate curves in a pipeline without resorting to pipe bending in the field.

Obstacles such as rock strata, buildings, poles and ground elevations need not delay pipeline construction. Special surveys, to avoid trouble at these points, are unnecessary.

None of the other Dresser advantages are sacrificed in building a curve in this manner. Dresser Couplings can be installed with the same speed, and assurance of no leakage, that is possible with straight-line building. No skilled workmen are required for any Dresser Coupling installation.

From 65 years of experience with all types of pipelines, Dresser has accumulated one of the most complete sets of pipeline data in the world . . . to help you build pipelines. Send us your inquiry on any pipe joining problem.

**DRESSER MANUFACTURING DIVISION**

### DRESSER COUPLINGS

for maximum  
joint  
flexibility

Style 38

Cross Section

Dresser Couplings are simply installed . . . and easily salvaged for new lines. Two resilient gaskets held in compression, grip pipe tightly . . . but also permit considerable latitude in pipe deflection to permit building curved pipelines. This flexibility also permits expansion and contraction of pipe sections without setting up harmful stresses . . . the key to the decades of service with practically no maintenance so characteristic of Dresser-coupled pipelines.

(Continued from page 8)

and generally supervise filter plant and system in city. Three-hundred forty-five of the former employees have reported and we have set up a temporary office in which I have a desk. They are taking hold in good shape but are handicapped by loss of supplies, equipment and vehicles. I am furnishing those from Army sources. The sewerage system was not greatly damaged. There are three lift stations on the north side all O.K. However, the whole system will run by gravity without pumping (electricity was off for about 22 days and now only restored to pump station on north side, filter plant and a few essential purposes) but of course many of the sewers were surcharged. I am making a survey tomorrow, if the snipers will let us, of four lift stations on the south side. We've had to work with guards and several mornings had to chase the "Nips" out of our gravel pit before getting gravel out.

The filter plant is modern and compares very favorably with ours in all respects. City is about 60 per cent watered and only 40 per cent is sewered. Before 3 February, unaccounted-for water ran about 25 to 30 per cent of total delivered—hardly any maintenance for the last three years. "Nips" took all vehicles and removed all catch basin gratings and now they are full of every thing under the sun, including dead Japs.

I've been recuperating from a fall off an aqueduct but am feeling fine now. We are nicely "situated" in the undamaged and completely furnished German embassy until we get kicked out.

(Continued on page 12)

### More Than Double Pump Life

Building sustained efficiency into the mechanical structure of a pump was a problem solved by Peerless engineers. Peerless engineering is precision engineering that permits closer tolerances which eliminate the customary vibration to an unusual degree. Thus, wear and tear are reduced; repair bills consequently are the lowest known.

 TURBINE PUMPS

### HOW TO RUST-PROOF SUBMERGED METALS... *Permanently*

DC electric current of low voltage, low amperage, properly balanced and controlled as required by the water through which it passes and the metal it is to protect, prevents corrosion of the metal by oxygen in the water. It therefore stops rust formation by oxidation. This is the Electro Rust-Proofing System of Cathodic Protection. It has been applied to thousands of tanks, standpipes, deep wells, flocculators and many other types of water storage and water handling equipment. It is engineered to every installation. It stops the formation of rust below the water line totally and permanently, therefore kills the greatest single item of tank maintenance cost, the major cause of tank depreciation. Recognized and advocated by independent authorities. Write for free data.

do you have this valuable  
80-page manual?

## Hypo-Chlorination of Water

*Sanitation HTH is  
available in cases of  
nine 5-lb. cans and  
in 100-lb. drums.*

"Hypo-Chlorination of Water" is a complete reference manual on the use of high-test calcium hypochlorite in the modern practice of safeguarding water supplies. Written in simple, non-technical language, it covers all phases of standard sanitation practice including instructions for emergency use; tables and charts showing qualities of Sanitation HTH required for many specific needs; algae and alkalinity control. Fully illustrated. Many schools have requested copies for student use in courses in water treatment.

Though more than 25,000 copies—in five editions—have been distributed to those interested in modern water and sewage treatment, Mathieson again offers the latest edition, free of charge, to newcomers in the profession and to those whose copies have "disappeared".

Send us a postal card—we'll mail your copy.

*P. S. Checked your stocks of Sanitation HTH recently? Remember—in an emergency you'll be glad to have an ample supply on hand.*

(Continued from page 10)

The July *Bulletin of the U.S. Army Medical Dept.* published this further news from Colonel Clark:

——I'm now in charge of the city water and sewage system and am chief of the Water Supply Section of Operations Division of Luzon Engineer District. . . . The amount of work to be done on repair of water distributing system is terrific. Even though there aren't many direct hits on the mains, the tremendous amount of shelling on nearby buildings has been enough to make for a generally leaky system. We now have nearly the whole north side in service, but in some places the pressure is weak. We have maintained 40 to 45 lb. downtown for the last two days. We have few sections in service on south side but there must be 80 per cent of the area burned and all of the big buildings demolished by mines and shellfire. Have over 500 former employees back in Metropolitan Water District Office and, except for repair of 72-in. concrete aqueduct, they are making all repairs. Yesterday 97 leaks were repaired. We're handicapped by lack of trucks and repair materials—not a single repair for broken hydrants; so we're having to make them, which is a slow process when they have to be turned out on lathe. Japs left little spare parts for anything. The big office and repair shops of the Metropolitan Water District are completely wrecked. Have fairly good supply of all sizes of pipe—no large size valves.

(Continued on page 14)

## Test our proven formula

*Experience + Equipment = Results*

and solve your water main cleaning problems

### NATIONAL has the *Experience*

Each NATIONAL Superintendent is a man of long experience in water main cleaning and has the added benefit of the Company's knowledge gained through 38 years—1907 to 1945.

### NATIONAL has the *Equipment*

For 38 years NATIONAL has been devising equipment to meet all sorts of pipe cleaning conditions.

### NATIONAL gets *Results*

A NATIONAL pipe cleaning job restores a pipe to almost 100% of its original carrying capacity; and the reduced operating costs which result save the cost of the cleaning many times over.

## IMPORTANT GENERAL CHEMICAL PRODUCTS FOR WATER & SEWAGE TREATMENT

### ALUMINUM SULFATE

Equally Efficient For Coagulation of Water & Sewage

Ammonia & Potash Alums • Aqua Ammonia • Anhydrous Bisulfite of Soda • Sodium Silicate • Sulfuric Acid • Disodium Phosphate • Trisodium Phosphate • Tetrasodium Pyrophosphate • Sodium Fluoride • Sodium Sulfite

### BAKER & ADAMSON

LABORATORY REAGENTS and FINE CHEMICALS

For almost half a century General Chemical products have been a familiar sight in American Industry. So numerous are their applications, and so vital their functions, that they have long been recognized as basic chemicals which help form the backbone of many principal industries.

Year after year purchasing and operation executives *select and specify General Chemical Products*, knowing that the quality and utility of these chemicals have been proved in production . . . meeting demands of the day.

Because General Chemical's research and manufacturing programs are both practical and progressive, they are geared to Industry's ever-changing requirements and anticipate its future necessities. That is why General Chemical products today are for today's processes . . . that's why General Chemical products of tomorrow will meet the new demands of the industrial world!

Filter plant will be operating in about six days. After two years of operating without alum, the filters are very dirty. We've washed the first one five times, and it's still not clean. Also have two engineer water supply companies set up, and they operate distribution points where we can't get city water to the area.

Sewage system O.K. except for burned motors at two lift stations which we can easily replace. Outfall to sea has been reported broken and have man out on that today. It's a 72-in. cast-iron line laid just below bottom. Will look for new diatomaceous filters. . . .

On July 2, Colonel Clark wrote to Association headquarters, adding the following information to his story:

— I hope time will soon permit me to write up some observations of Manila System. Maj. L. H. Scott [formerly of Oklahoma City, Okla.] has charge of city system now. . . .

[When] Ipo Dam [impounding reservoir] was finally taken . . . [it was found] much to everyone's surprise [that the Nips] hadn't done any damage to dam or gate works. They did blow the aqueduct running to Novaliches Reservoir in one or two places but [the breaks] were repaired in short order and water was released to the reservoir only a few days before its supply would have been exhausted. Reservoir is now filling in good shape and as far as supply is concerned it will be more than adequate from now on. Major Scott tells me consumption is running around 50 mgd. now.

I will be happy to transmit A.W.W.A. greetings to Met. Water District and especially to Mr. Perlas, Supt. of Bolora Filters and Stored Water Supplies. He . . . has told me all about the fine trip he had in the States [in the late thirties]. Perlas had some trying times with the Nips and I'm afraid they added some grey hairs to his head. However, he did a good job—he held out a good supply of alum and liquid chlorine which we used after capturing the plant. He also talked the Nips into permitting him to remove the two W & T chlorinators from the chlorine house and thus saved them from damage or loss. He was able to install them and start them operating in two days despite a few missing parts. He has been very grateful for the help the Yanks have given and he has co-operated in every way. His plant and lab building housed combat troops for several months and his back yard was used for mortar emplacements. . . .

# Essential to Growth

## Properly Refined Water

Cities and towns prosper and grow, or become decadent, depending upon the prosperity of their business and industry, and the happiness of their citizens. In thousands of American communities, *properly* refined water has made the difference. But refined or treated water is not enough. It must be **PROPERLY** refined! Refinite methods are backed by over a quarter of a century of research, engineering, and manufacturing of refining equipment for municipalities, institutions, and industrial plants the nation over. Each installation is individually designed to *properly* refine the problem water . . . to give maximum economy. If you have a water problem, consult Refinite now.

**The Refinite Corporation**

408 Refinite Building

Omaha, Nebraska

**The thirst for scientific literature** in European countries, where books both were destroyed and failed of production during the Occupation, is poignantly illustrated in a letter from the office of the Executive Secretary of the General Association of Hygienists and Municipal Technicians, Paris. A complete series of JOURNALS, from July 1940 to date, have been dispatched.

Similar requests are, however, difficult to fill because the supply of some back numbers of the JOURNAL is almost depleted. Any A.W.W.A. member who possesses any of the following issues is urged to sell them to the Association's headquarters office at \$.50 a piece, for redistribution to European libraries:

SECRÉTARIAT GÉNÉRAL

Sir,

The latest number of your interesting review we received was issued in June 1940. Since that day, neither you nor us could keep in being the exchange of your publications. In fact, we had to cease the issueing of the "Technique Sanitaire & Municipale." We could only print a little more than a dozen of Bulletins, of which we are including a sample copy.

We should be very glad to keep up to date our collections so that our members can be aware of that happened in matter of water works in your country.

So, we offer to send to you all the Bulletins we issued and would be very glad to receive this various numbers of the "Journal of the American Water Works Association," that were printed since July 1940.

If you do not agree with this offer, please let us know how much money we shall send to you to receive those numbers.

Yours faithfully  
/signed/P. Descroix

This letter was followed by another, reproduced below:

Paris, le May 28th, 1945

Dear Sir:

I was very glad to receive your kind letter of April 13th, which, thank to the air mail, crossed the ocean in one month, instead of five by the ordinary ways of the Post Office.

I am mailing the copies of our Bulletin we issued since 1940, being only sorry that, owing to the War Regulations, we could do no more: in fact, our "Technique Sanitaire et Municipale" was not allowed to appear . . . and is still not, so that, issuing something else in lieu of it, we had to christiannize (sic) it "circular." Happily, we owned some paper in 1940: with the same, we must last as long as possible.

I personally wrote a law thesis, about "Le régime juridique des eaux souterraines en France et à l'étranger" (The underground water statute in France and abroad) for which I owe very much to MM. David G. Thompson, Albert G. Fiedler, W. G. Irving, and, generally, to your JOURNAL. I also mail one copy of it to your address. . . .

Yours faithfully,

/signed/ P. Descroix  
Secrétaire général

61 CODDING ST., PROVIDENCE 1, R. I.

**WE'RE GOING TO REWARD  
YOUR PATIENCE!**

We've never forgotten you, even when we were busy night and day, trying to crowd two days' work into one for Uncle Sam.

We have appreciated, more than we had time to express, your good-natured patience in waiting month after month for goods which you wanted and needed. But neither you nor we could look our boys in the eye when they come home, if we had made no sacrifices to make their going easier and faster.

Whether it's before or after V-J Day, just as soon as Uncle Sam releases a machine that's working for him, it will begin again to work for you.

When we get back to "normal" it will be a bigger and better normal than ever, with many new improvements and new items and vastly increased production capacity. But one thing won't be changed—you'll still get the old-fashioned Hays consideration and the old-fashioned fair and friendly treatment.

(Continued from page 20)

**H. A. Murchison**, Sales Engineer in the Florida Territory for the Permutit Co., died on May 14 in Jacksonville at the age of 59. Mr. Murchison had been associated with the Permutit Co. since 1927. He had been active in the affairs of the Florida Section of the A.W. W.A. for the past eight years.

**Malcolm Pirnie**, Cons. Engr., New York City, received the honorary degree of Dr. Eng. from Rensselaer Polytechnic Institute, Troy, N.Y., on June 22. A captain in the last war and a consultant to the War Dept. in this one, Pirnie, in his address to the graduating class, urged universal conscription. Pirnie is a Past-Pres. of A.W.W.A. and a Diven medalist. He is currently serving as Chairman of the Com. on Water Works Practice, the governing body of all technical activities of the Association.

**Roswell M. Roper**, Engr. and Gen. Mgr., Board of Water Comrs., East Orange, N.J., and **W. R. Conard**, Cons. Engr., Burlington, have been appointed by Gov. Walter E. Edge to the New Jersey Water Policy and Supply Council, successor to the New Jersey Water Policy Com. (see JOUR. A.W.W.A., 37: 457). The legislature's reorganization measure created a new state department of conservation, consolidating a number of existing departments, boards, commissions, etc., under one head, with a commissioner to manage the whole, and without disturbing the working members of any. However, the departments, boards, commissions, etc., were turned into councils to care for each, and the membership of each council was increased to nine, the members serving without compensation.

# *Trust the Pipe You Know About*

The gates of the dam which has been holding back urgently needed water works and sewage works improvements for nearly five war years are opening. Meanwhile, cast iron pipe is obtainable, is being produced in steadily increasing volume without detriment to war orders, and to a limited extent is available from stock on hand for immediate delivery.

We go on record as follows: You can confidently expect to get cast iron pipe when you need it as quickly as any substitute pipe—and quicker, in most instances, since cast iron pipe foundry facilities have remained intact, as they had to, because of war construction requirements. *They do not require reconversion.*

Put your trust in pipe you know about—cast iron pipe with its history of long life and low maintenance cost. We might also say, with good reason, the pipe almost *everybody* knows about, since it has been advertised to the public for 20 years.

Cast Iron Pipe Research Association, Thomas F. Wolfe, Research Engineer, Peoples Gas Building, Chicago 3, Ill.

# HYDRO-TITE

## AND DRY BRAIDED FIBREX

**A DEPENDABLE SELF-CAULKING  
JOINT COMPOUND FOR  
CAST IRON BELL AND SPIGOT  
WATER MAINS**

**HYDRO-TITE** is a self-caulking sulphur base jointing compound used to joint bell and spigot cast iron water mains and soil pipe. It comes in powder form which insures uniformity and quick melting.

When poured into a joint, **HYDRO-TITE** immediately solidifies upon contact with the metal and bonds to both the surfaces of the bell and the spigot for the entire depth of the joint. It requires no caulking and after pouring a joint, water pressure may be immediately applied.

**HYDRO-TITE** is easy to use, no skill being required to make joints that are tight from the start. Joints made with **HYDRO-TITE** will stand any pressure the pipe will stand.

### DRY BRAIDED FIBREX

**USED LIKE BRAIDED JUTE  
WILL NOT BREED BACTERIA**

**A SANITARY** Packing used in jointing bell and spigot pipe for water, sewer mains and soil pipe.

**FIBREX** was designed for use with Hydro-Tite and other self-caulking compounds, but is entirely suitable also for joints made with lead, and for Sani-Tite and other asphalt sewer joint compounds. Thousands of pounds of Fibrex are already in service on water lines throughout the country.

Works: WEST MEDFORD STATION, BOSTON 56, MASS.

## Famous Facts

The first Pony Express started from both Sacramento, Calif., and St. Joseph, Mo., 1,960 miles apart, on April 3, 1860. There were 80 riders and 420 horses. Letters were carried for \$5 each until the service ended in October, 1861.

By 1860, Bitumastic Enamel—the first product of its kind—had already won acclaim as an outstanding protective coating for ships against internal corrosion in bilges, double bottoms, coal bunkers, and other surfaces exposed to severe corrosion.

Bitumastic Enamel has an outstanding record in protecting water and sewerage pipe lines in the major cities of the United States. Used as a spun lining, it prevents tuberculation and rates a Williams and Hazen Coefficient of 155 on pipe of 16 inch diameter or larger. As a coating it assures maximum service life.

Bitumastic Enamels can be applied by your own workmen under certain conditions or by our contract department.

# HELLIGE COMPARATORS

FOR pH AND OTHER POPULAR WATER TESTS

WITH

## HELLIGE

## GLASS STANDARDS

You do not need to make your own standards, or wonder whether prepared standards have faded, if you use Hellige Glass Color Standards, which are perpetually guaranteed against fading. Their long life and reliability make them the choice of hundreds of water plants. Hellige Comparators equipped with glass color standards are durable, compact and efficient.

## how to make water "come clean!"

Sparkling cascades carrying the wastes and impurities of industrial plants . . . jungle streams infested with deadly water-borne germs . . . impure water on home and battle fronts can really "come clean" with SOLVAY Liquid Chlorine.

Treat germ-laden, dirtied water with SOLVAY chlorine and impurities, foul taste and odors are rendered harmless. SOLVAY Liquid Chlorine is the Army and Municipal Engineer's unique "come clean" treatment for water.

## HALF A HEMISPHERE Spanned in Service

To users of Dorr equipment in all fields throughout the North American Continent, The Dorr Company offers quick, expert, engineering service . . . to a water works in Mexico, a sugar central in Cuba, a sewage disposal plant in Newfoundland, a paper mill in Quebec or a gold mine in Alaska.

The Dorr Company maintains a staff of thoroughly trained engineers at strategic points throughout *half a hemisphere* to render immediate service wherever and whenever needed . . . service in all fields to all Dorr installations whether they consist of a single piece of equipment or a complete process plant.

This extensive service is the direct result of a fundamental sales policy of The Dorr Company—Dorr takes the view that it sells not merely equipment but *the solution to the problem for which the equipment is intended*. Therefore, Dorr's interest in the purchaser does not end at the time of installation but continues far beyond. Dorr equipment provides an efficient, economical solution of the client's problem.

Avail yourself of Dorr's comprehensive knowledge of a wide variety of fields; gain the advantage of the service of Dorr engineers; take up your process equipment problem with The Dorr Company.

## FIRST IN QUALITY— Long Life and Low Operation Cost

Layne Well Water Systems and Layne Vertical Turbine Pumps are unmatched in long life and low operation cost. This means that they are a city's very best investment.

The installation of a Layne Well System involves principles developed and used exclusively by Layne—principles that invariably increase the production capacity and guarantee longer life.

Right now Layne engineers are extending aid to cities and towns that have or will soon have water development problems. Write for further information, catalogs, bulletins, etc.

## WINCHESTER, MASS. RE-ORDERS %PROPORTIONEERS%

1935  
and still  
going strong

At South Station, the 4 original Automatic and Proportional Chlor-O-Feeders modernized with Plastic Heads are still in use.

1945  
Improved design  
same dependable  
performance

North Station showing installation of 4 latest Automatic and Proportional Chem-O-Feeders.

### • ANOTHER TYPICAL SERVICE RECORD OF %PROPORTIONEERS% AUTOMATIC AND PROPORTIONAL CHEMICAL FEEDERS

Ten years ago the Water and Sewer Board of Winchester, Mass., through its chairman, Mr. E. C. Sanderson and Supt. Mr. H. W. Dotten, purchased four %Proportioneers% Automatic and Proportional Chlor-O-Feeders, paced by two Hersey Detector Meters, (control range 40 to 6400 g.p.m.) to sterilize the entire Winchester water supply. In 1936 four additional %Proportioneers% Chemical Feeders of larger capacity were installed for injecting lime slurry as made up continuously by Omega disc type dry feeders. The original Chlor-O-Feeders, now with Plastic Heads, are serving

dependably at North Station, two feeding hypochlorite and two Calgon.

In 1945, the same Water and Sewer Board members, thoroughly satisfied with the performance of this equipment, selected the latest %Proportioneers% Automatic and Proportional Chem-O-Feeders to handle the hypochlorite and Calgon feeding at the North Station.

%Proportioneers, Inc.% is continually working to design and produce the best proportioning equipment available at a reasonable price.

## For Bottle Tight Joints Under High Gas or Liquid Pressure

### Use MONO-CAST DOUBLEX SIMPLEX PIPE

The Doublex Simplex Joint on Mono-Cast Pipe makes a bottle-tight joint under operating pressures in excess of 500 pounds gas and 1,000 pounds liquid. Mono-Cast Centrifugal Pipe with Doublex Simplex Joints with plain rubber gasket and lead ring packing are desirable for conveying gas, oil, gasoline, water, sewage and other fluids where the temperature does not exceed 175° F. For higher temperature service, asbestos gaskets are available. This joint allows for liberal deflection and longitudinal expansion and contraction in the line without danger of leakage.

## Some data from a steel mill that apply to **scale** in water heaters

Scale is a problem wherever pipes carrying hard water are exposed to heat, whether they are in a home water heater or in a reheating furnace in a steel mill.

Steel mill skid pipes, which form a path on which billets to be reheated are slid through the furnace, get rougher treatment, with furnace temperatures of 2500°F and white hot billets sliding along the top surface—but the thermal conditions in home water heaters are equally severe.

In both instances, the simplest and most effective solution of the problem is the same—threshold treatment with Calgon.\*

The photograph tells the story. Both pipes were in service for eight months, but water circulating through the one at the top was treated with Calgon. As a result, it is just as free from scale as the day it was installed. And note how well Calgon has controlled corrosion of the bare iron surface.

In hundreds of American communities, Calgon is used in water supply systems to prevent scale, inhibit corrosion, stabilize pH values and prevent precipitation of dissolved iron. A few ppm is all that is required.

Let us send you full information about it.

*\*Calgon is the registered trade-mark of Calgon, Inc., for its glassy sodium phosphate products.*

(Continued from page 50)

A complete new line of LaMotte Chlorine Control Units has been made available, paralleling the recent advances in the more effective chlorination procedures, involving free chlorine, hypochlorites and chloramines. The latest recommendations of the Committee on Control of Chlorination of the American Water Works Association have been followed, and a new series of standards has been prepared of a size interchangeable with the regular LaMotte pH color standards. Equipment is provided for making the ortho-tolidine-arsenite test, which makes it possible to measure separately chloramine and active chlorine and in which it is possible to estimate the error that is caused by other interfering substances. A pamphlet describing the ortho-tolidine-arsenite test is available from the LaMotte Chemical Products Co., Towson, Baltimore, Md.

Wayne H. Schultz has returned to the staff of Hill, Hubbell & Co., a division of General Paint Corp., Cleveland, Ohio, as Field Engr. and Eastern Representative after a leave-of-absence during the emergency. Schultz specializes in the coating and wrapping-and-lining of steel pipe for water works and sewage purposes, as well as the coating-and-wrapping of steel pipe for oil, gas and other industrial uses.

## NEWS OF THE FIELD

**Policies of the war agencies** which control allocations and prices of materials must be expected to affect the civilian economy unevenly during the transition from war production to peacetime commerce. During June and July the War Production Board issued a series of orders which were intended to place civilian production "on its own" as promptly as possible. The end of the allocation system for civilian agencies was set to become effective Oct. 1, 1945. As this was being done the WPB recognized that competition for materials would produce bottlenecks and that consumer goods industries would be in a position to unbalance the supply situation seriously.

The OPA has not been in accord with this program and the entire situation was placed before President Truman. On August 9 the President wrote J. A. Krug, WPB Chairman, as follows:

I request you to continue the following program which you have been carrying out:

1. A vigorous drive to expand production of materials which are in short supply, not only because of military demands, but to meet civilian demands as well.
2. Limitation upon the manufacture of products for which materials cannot yet be made available, so as to avoid excessive pressure on supply which would threaten our stabilization program.
3. A broad and effective control of inventories so as to avoid speculative hoarding and an unbalanced distribution which would curtail total production and endanger our stabilization program.
4. Granting priority assistance to break bottlenecks which may impede the reconversion process.
5. Allocation of scarce materials necessary for the production of low-priced items essential to the continued success of the stabilization program.

Since the President's letter was written, the policies of the WPB have been modified accordingly. After August 22 (release No. 8912) no AA preference ratings can be assigned (except as they apply to textiles) for deliveries after September 30. The AA rating system and the Controlled Materials Plan remain effective on deliveries prior to October 1. All AA ratings for deliveries after September 30 are cancelled. The CMP is revoked as of September 30. All allotments of steel, copper and aluminum for the fourth quarter of 1945 are cancelled. This completely frees the market for the three metals from WPB controls after September 30.

(Continued on page 2)

*(Continued from page 1)*

There will be three ratings after September 30: AAA for "top priority," MM for "military" and CC for "civilian." The CC rating will be used sparingly by the WPB and then only to break bottlenecks in reconversion and to insure, when necessary, continued production and services in essential fields and to protect public health and welfare or prevent extraordinary hardships.

This must be understood—it will be practically impossible for the A.W.W.A. office to keep the water works field informed as fully as could be desired, because no one knows what policies will be in effect 30 days from this writing. The best policy for water works men to follow is to use the ratings to which they have been accustomed until no doubt exists in any quarter that ratings are needed.

**Carlos S. de Santamaria**, San. & Civ. Engr. and recently Mayor of Bogota, Colombia, has been appointed Colombian Ambassador to the United States. Señor de Santamaria has been a member of the Association since 1935, and many of his fellow-members will remember having met him at the Toronto convention in 1941. He is the first member of the A.W.W.A. to become an ambassador.

The Los Angeles Dept. of Water & Power has made further changes in its staff (see News of the Field, June JOURNAL). **Frank Twohy**, formerly Asst. Controller of the Water Dept., has been appointed head of the Accounting Div. Born in Duluth and engaged in business elsewhere on the West Coast before coming to Los Angeles, Twohy joined the department as general clerk on the night force of the bookkeeping section in 1925. In 1928 he was made head of the tabulating section, and in 1939 he became Asst. Controller. He has achieved a national reputation for his development of new ideas in the design and application of tabulation machines for public utility commercial and accounting work.

**Wayne W. Wyckoff** has been made Engr. in Charge of the Aqueduct Div. A native of Ohio, Wyckoff is an alumnus of the Univ. of California, at which he earned a Civ. Eng. degree in 1925. His first engagement with the Los Angeles Water Dept. was as Jr. Civ. Engr. on the Colorado River survey project, which was subsequently taken over by the Metropolitan Water Dist. He was Resident Engr. on the Mono Basin project for three years, and was appointed Asst. Aqueduct Engr. in 1941.

**Emil Breitreutz**, Asst. Engr. of Pipe Construction for the past twenty years, has been made head of the Water Distribution Div.

Breitreutz completed his college education at the Univ. of Southern California in 1906 and taught the first surveying class at that institution. During the same year, he joined the Los Angeles Water Dept. as instrument man on the aqueduct project, and thus holds one of the longest tenures in the department. He performed both engineering and clerical duties during the construction of the aqueduct and in 1913 was transferred to the Street Mains Div., when the entire office force consisted of only four men. He has been with that division, now known as "Water Distribution," ever since.

## DOWN BELOW LEAD SERVICES RATE HIGH

**L**ead pipe's flexibility prevents damage by ground movement or settlement and eliminates many joints. Thick walls of corrosion-resistant lead result in great durability and freedom from clogging.

That's why wise engineers reduce long-term costs by using lead services. Lead's additional first cost is infinitesimal when all the costs of installing any kind of service — paving, trenching, backfilling and so on — are considered.

Insist on lead pipe and calking lead meeting recognized national standards such as Federal Specification WW-P-325, Lead Industries Association Standards, or CS94-41 and CS95-41 of the National Bureau of Standards. Such lead products may be identified by this Seal stamped on them for your protection. Write us for copies of these standards and specifications and for our free magazine, "Lead."

### Why they keep calling for calking lead:

1. *Flexible joints take up ground movement without damage to pipe or joints.*
2. *Quickly repaired by simple re-calking without interruption to flow.*
3. *Generations of proved performance.*
4. *No close temperature control needed.*

**George J. Schroepfer** has resigned as Chief Engr. and Supt. of the Sewage Disposal Plant, Minneapolis-St. Paul San. Dist., to accept an appointment as Prof. of San. Eng. at the Univ. of Minnesota. Schroepfer has headed the Twin Cities plant since it was put into operation seven years ago, and the \$17,750,000 sewage disposal system has treated 270 mil.gal. of sewage during that period. Schroepfer is Past-Pres. of the Federation of Sewage Works Associations and is a member of the Committee on Water and Sewage Works Development.

**Capt. Kerwin Mick**, now overseas in the Pacific, has been appointed by the Board of Trustees of the Metropolitan Drainage Com. to succeed George J. Schroepfer as Chief Engr. and Supt. of the St. Paul-Minneapolis Sewage Disposal Plant. Before entering military service in 1942, Captain Mick was Chief Chemist at the plant. He was graduated from the Univ. of Minnesota in 1930 with a degree in Chem. Eng.

**W. S. Bronson** has resigned from the position of Supt. of Municipal Light and Water, Ft. Madisonville, Ky., after five years there, and is now associated with the General Electric Supply Corp., Louisville, Ky.

Initial high pump efficiency is sometimes obtained by the use of excessively close clearances between wearing rings, but, attained in this way, it is not long maintained, particularly where flat rings are relied upon.

*De Laval Labyrinth Wearing Rings* maintain high efficiencies over long periods of use but are little affected by wear due to the small flow and low velocities between these large clearance rings.

For further particulars ask for Publication P-3225.

## Test our proven formula

*Experience + Equipment = Results*  
and solve your water main cleaning problems

### NATIONAL has the *Experience*

Each NATIONAL Superintendent is a man of long experience in water main cleaning and has the added benefit of the Company's knowledge gained through 38 years—1907 to 1945.

### NATIONAL has the *Equipment*

For 38 years NATIONAL has been devising equipment to meet all sorts of pipe cleaning conditions.

### NATIONAL gets *Results*

A NATIONAL pipe cleaning job restores a pipe to almost 100% of its original carrying capacity; and the reduced operating costs which result save the cost of the cleaning many times over.

## FOR PLAIN-END PIPE

(Continued from page 10)

The Westchester, N.Y., Water Operators Association held an annual "get-together" at Scarsdale, N.Y., on July 19. About 150 Westchester operators, many of whom are A.W.W.A. members, attended. It has been reported that "on account of inclement weather, the usual sports activities could not be held, but this was made up for by a splendid dinner followed by no speeches." James C. Harding, Westchester County Comr. of Public Works, was elected chairman and Arthur G. Jewell, Supt., Mt. Vernon Water Dept., and J. E. Flanders, Operating Vice-Pres., New Rochelle Water Co., were made trustees.

**Correction:** In reproducing in the July JOURNAL the graph compiled and executed by Past-Pres. Samuel F. Newkirk Jr. to illustrate membership growth of the Association, the JOURNAL neglected to credit *Taste and Odor Control Journal* for May 1945 with the first publication of the graph. *Taste and Odor Control Journal*, published monthly by the Industrial Chemical Sales Div. of the West Virginia Pulp & Paper Co., devoted a major portion of its May issue to singing the praises of the A.W.W.A.

(Continued on page 18)

## CYANAMID

# *Sulphate of Alumina*

CYANAMID through the control of its basic raw materials can assure you of a uniform high quality product at all times.

It assists in the removal of taste and odor.

It is and remains free flowing.

It is less corrosive than other coagulants.

It does NOT clog the dry feed machine.

It precipitates over a much wider pH range than other coagulants.

Your inquiry is invited on CYANAMID quality Sulphate of Alumina.

# Prerequisites for Efficient Water Systems

## STOPS AND FITTINGS

**F**OR efficient, uninterrupted water service, all materials, particularly stops and fittings, should be of the first quality. For over seventy-six years Hays has specialized in the production of these materials. Throughout these years quality, insuring dependability, has been the foremost consideration. Annoyance, inconvenience and expense can be avoided by using Hays water works materials, in original installations, as well as in any replacements, since Hays Stops and Fittings are interchangeable with all other makes.

Hays Water Service Brass Goods Catalog shows illustrations and gives full description. Send for your copy.

CURB STOP

CORPORATION STOPS

- All Hays Brass is of 85-5-5-5 Mix.
- Each piece is tested at 200 pounds hydrostatic or more.
- Individually ground plugs are especially lubricated for easy turning.
- Water Works Standard Threading permits use of Hays Stops and Fittings in any standard tapping machine.
- Interchangeable with all other makes.

# THERE'S A STRING OF THEM NOW

## ACROSS THE COUNTRY

**Producing Clear, Soft, Iron-Free  
Water for Many Municipalities**

When it's reconversion time, there will be new materials, methods and ideas to be developed and perfected and molded into useful equipment . . . equipment which eventually will find application in important beneficial public works improvements.

In the Water Conditioning Field, however, there is no need to wait for this "miracle" equipment to materialize because

ACCELATORS had already gone through the developing and trying-out stage before the war. There's a string of municipal Accelerator installations across the country now

ACCELATORS are doing a lot of different things for a lot of different kinds of water . . . clarifying . . . softening . . . stabilizing . . . removing color . . . taking out iron.

Results are always excellent . . . frequently remarkable.

You can't beat ACCELATORS for Performance and Economy. Would you like Bulletin 1824?

# STOP FISH

# BY ELECTRONICS

This patented fish control method employs modern electronics in overcoming a serious operating and maintenance problem. Fish of all sizes are kept at a *safe distance* from intake structures, or screens, by the use of an Electronic Control Unit. This equipment, generating special electrical impulses, energizes an electrode system designed and engineered for your particular fish control problem.

The Burkey Electric Fish Screen has been thoroughly proven through years of service in Condensing Water Intakes, Hydroelectric Plants, Water Systems and Industrial Pumping Installations.

**THE AMERICAN WELL WORKS**  
 MANUFACTURERS OF  
 Pumping, Sewage Treatment, Water Purification Equipment  
 AURORA ILLINOIS

Contaminated water can be cleaned *right through* with the cleansing and purifying powers of SOLVAY Liquid Chlorine.

This orange liquid is safeguarding the health of our soldiers by "washing out" impurities, foul taste and odors from water supply units. And over here, municipal water works systems also rely on this effective liquid to purify drinking water and safely dispose of sewage wastes.

Always...treat germ-laden, dirtied water with SOLVAY Liquid Chlorine —*It cleans right through!*

## HIGH QUALITY VALVES HYDRANTS

M & H products, including pipe line accessories, are well known for high quality of material and expert workmanship. They are made according to standard specifications and have been used for many years throughout the country. Write for Catalog No. 34. Address M & H Valve and Fittings Company, Anniston, Alabama.

*ASBESTOS IN ACTION*

**K & M "Century"**  
**ASBESTOS CEMENT PIPE**

*Quick to Install*

*Easy to Handle*

**B**ecause K&M "Century" Asbestos-Cement Pipe is so light, so easy to handle and so durably strong, it costs less to haul, less to install and less to maintain.

K&M "Century" Pipe is a wise choice from many angles. Being non-tuberculating, it assures full flow with minimum friction. Being non-metallic, it will not corrode. Its flexible joints not only couple up faster and allow wide radius curves without the use of elbows, but are immediately and permanently tight. Furthermore, this pipe may be removed and successfully re-installed many times if necessary.

K&M "Century" Pipe conforms to Federal Government Specification SS-P-351.

Nature made Asbestos... Keasbey & Mattison has been making it serve mankind since 1873.

You can do no better service to your community than to make K&M "Century" Asbestos-Cement Pipe a part of your present or post war expansion plans.

**KEASBEY & MATTISON**

*(Continued from page 44)*

"Water Lines" of the Indianapolis Water Co. for July 27, had the following meter reader's adventure to report:

Harold Fox believes in the Friday the 13th superstition. While reading meters that day, a dog took after him. Harold lost his trouser seat escaping. Then, re-trousered, he ripped the new pair on a nail in a basement. Not content, a wire on a gate cut his leg. Waiting for a trolley, he was hit by a hit-and-run driver. The police, after capturing the driver, returned and took Fox to the hospital for treatment. However, he played safe and refused to ride the ambulance home. Afraid his grandmother would see it drive up and have to make the return trip in it.

Roy Gordon Thompson, So M3/C, another Indianapolis meter reader, wrote home from the high seas:

I was down in the engine room today and guess what I ran across? A nice memory-bringing water meter! Not exactly like the ones I used to read but it looked pretty good. Water was measured in gallons instead of cu.ft. like we have. You see, we make our own drinking water. They make it in an evaporator and then we have it stored in tanks in the bilges. That way we have it all over the Army since we have good cold, pure water to drink all the time. . . . Oh, by the way, when we were in Manila, I saw a Ford Meter Box on a curb. They must have those all over the world. It was all broken, but I could still read it. I can't remember offhand, but it had been used quite a bit.

Formerly, complete shutdown at least once a day—now, easy routine flushing\* once a week! Simplex Air Release Valves at the Pottstown Sewage Works maintain peak operating efficiency of sewage lines and pumps—eliminate frequent and costly shutdowns caused by trapped air and gases from decomposing organic matter.

Simplex Type "B" Valves are especially designed to meet the particular conditions of sewage service. Construction is simple and dependable. There is but one lever movement which operates a needle valve so designed as to be always tight-seating. The valve is operated by a heavy thickness glass ball float, tested to several times the service working pressure. A cast iron shell houses the actuating parts which are of corrosion-resisting materials.

Simplex engineers will gladly assist in the solution of your sewage flow problems. Write today for details.

*\*Routine weekly back-flushing at Pottstown Sewage Disposal Works, Pottstown, Pa., accomplished merely by opening the valve below hose connection shown to allow clear water to fill the release valve and the system. Flush is quickly and easily completed without dismantling any part of the installation.*

supplementary cost and trouble preparing duplicate bills for those which became lost under the old method of delivery. Because of the type of billing machines in use, the dates of the period being billed have to be omitted on the postal cards. However, there has not been any consumer protest against this so far.

The Food Machinery Corp. has purchased the Dayton-Dowd Co., large independent pump company at Quincy, Ill., and will make it a branch of the Peerless Pump Div., Los Angeles. Clarence M. Frazier, Vice-Pres. of Peerless Pump, will be in charge. Henry J. McKenzie, formerly Asst. Mgr., Peerless Pump Div., will be manager of the new branch in Quincy.

*(Continued on page 54)*

## A MESSAGE TO WATER WORKS OFFICIALS...

No peacetime industry has escaped the consequences of total war. Dislocations, restrictions, emergency regulations, shortages in labor and supplies, etc., have hampered operations for all, some suffering more severely than others.

As a result of war contingencies during these past few years which have been so hectic, the American Norit Co., Inc., has been forced to severely curtail its production of water carbons. It is hoped, however, that full scale production can be resumed soon, enabling us to meet all demands for NORIT with the same promptness as before the war.

**BUILDERS SHORT VENTURI TUBE—  
MODEL VTS4**

Builders Venturi Tubes have long been the accepted standard for metering water and sewage. In many an installation . . . even after twenty-five years or more of continuous operation . . . Builders Venturi Tubes still meter with their original accuracy.

Builders Herschel Standard Venturi Tubes embody the improvements made in over half a century, and have interchangeable throat sections for easily changing the capacity of the meter. Model VTS4 Venturi Tubes are shorter, somewhat lower in price, but pressure loss is slightly greater and throats are not interchangeable.

For Bulletins and complete information address Builders-Providence, Inc., (Division of Builders Iron Foundry), 25 Coddington St., Providence 1, R. I.

*Sincerely*

**BUILDERS-PROVIDENCE**

(Continued from page 54)

canized circumferential seams and stave pockets. The vinyl-coated tank is essentially of two-ply construction, fabricated from spread-coated fabric, using sewn radial seams and with zipper closures on stave sheaths. A circular ground cloth provides protection against puncture of the bottom of the GR-S-coated tank. Although a ground cloth is shown under the vinyl-coated tank also, it is not actually needed because of the multi-ply construction.

Each tank is 11 ft., 3 in. in diameter, with a 54-in. sidewall and a capacity of 3,000 gal. The GR-S-coated tank weighs 350 lb. and the vinyl-coated tank weighs 300 lb. Both the synthetic-rubber-coated and the vinyl-coated fabrics are completely watertight, mildew resistant, durable, stronger than canvas, non-toxic and impart no taste or odor to the water.

Widely used for metering water at ordinary temperatures, the Builders Propeloflo Meter is now available at no extra cost for metering hot water up to 250° F. A special high-temperature grease is employed for efficient lubrication. Venturi design and all other special features of the meter are retained. The Builders Propeloflo Meter is manufactured by Builders-Providence, Inc. (Div. of Builders Iron Fdry.), Providence 1, R.I.

## NEWS OF THE FIELD

**The Office of War Utilities terminated its activities** on September 28, 1944. This important agency of the War Production Board began its work as the Power Branch early in 1942 under the leadership of J. A. Krug, now Chairman of the War Production Board. In August of 1942, the Water Division was organized under the direction of Arthur Gorman.

The American Water Works Association can properly speak for the industry and state that the Office of War Utilities and its Water Division have rendered invaluable service to the American public through their intelligent support of the needs of the water works field for materials required in support of the war effort.

In rendering this broad and fundamental service it has repeatedly been necessary for the WPB to deny or modify applications for material requested by water works agencies. But no water utility has failed to meet the real needs of the war effort, so far as it was called upon to meet them, because of the denial of its requests by the WPB.

In retrospect it appears possible that more frankness concerning the critical nature of the over-all supply situation might have reduced the irritation of those water works executives who were denied what they wanted. But who is so naïve as to assume that frankness can ever be a part of making war? The enemy always has his listening posts and the part of the good utility executive in war is to produce more and more under greater and greater restrictions. That is just what all the utilities—water, gas, power, communications, transportation, etc.—did. And they did it with the effective support of the War Production Board through its Office of War Utilities. To Nelson, Krug, Marks, Falck and, most of all, to Gorman (and to Wolman behind the scenes) the water supply field pays tribute.

**President Truman**, in his recent message to the Congress, strongly emphasized the danger in setting up a public works program that would compete with private industry for material and manpower. "States and local governments should be encouraged to construct useful public works of the types that must necessarily supplement and go along with the private construction of homes and industrial facilities. If private construction is to move forward at a rapid rate, it is vitally important that local governments promptly proceed with the construction of such facilities."

*(Continued on page 2)*

*(Continued from page 1)*

ties as streets, sewers, water supply, hospitals, airports, schools and other necessary public facilities. Such projects should be undertaken at this time where they supplement and encourage private construction, not where they compete with it for manpower and materials." This gives repetition, through the voice of the nation's leader, to the ideas expressed by the Committee on Water and Sewage Works Development: "Promote to the fullest extent public works which serve the community and the industries located there so long as the works are planned upon a self-supporting basis and so long as they are clearly needed to promote the growth of the city and its industries."

The factors for industrial progress are so powerful just now that wisdom will lead the nation to give these factors the opportunity to get peacetime pursuits under way. If, in the temporary period of readjustment and transfer of labor from war production to peacetime products, the "pump-priming" idea of emergency public works gets rampant and gains Congressional support, the competition which President Truman fears will dislocate, if not seriously impede, the normal travel towards recovery and progress.

**Roland C. Harris**, Civic Commissioner of Public Works, Toronto, Canada, died suddenly on September 3 at the age of 70. He was an Honorary Member of the A.W.W.A.

Much of the water and sewage works system in Toronto was constructed under Mr. Harris's leadership. He became works commissioner when the department was formed in 1912. His first job was as an office boy in the City Hall. In 1899, he entered civil service and was Property Commissioner by 1905, at the age of 30, and Street Cleaning Commissioner by 1910. He held many important public appointments, serving on numerous boards where his varied knowledge was found valuable. He was well known and popular in the Toronto government and in the press for his forthright reports on the affairs of his department and for his clarity in answering questions concerning those affairs. His recommendations were nearly always accepted by the Toronto City Council.

Although Mr. Harris had not had specialized engineering training, he was a prodigious reader of technical material in the field and was considered to have a broad engineering knowledge.

**Joseph L. Quinn Jr.** has resigned from his positions as State San. Engr. of the Indiana State Board of Health, Technical Secy. of the Indiana Stream Pollution Control Board and a member of the Flood Control and Water Resources Com., to assume the duties of Asst. to Pres. Anton Hulman Jr. of Hulman & Co., Terre Haute, Ind., manufacturers of Clabber Girl Baking Powder. Hulman is Chairman of the Indiana Flood Control and Water Resources Com., and is engaged in several other public service activities.

Quinn is Chairman of the Indiana Sec., A.W.W.A., and won the 1945 Fuller Award in that section. He is also Secretary of the Public Health, Water and Sewerage Development Organization and is officer or member of a number of other technical organizations and societies. He was graduated from Purdue Univ. with the degrees of B.S.C.E. and C.E., and had been employed by the Indiana State Board of Health since 1939. Before

# Keep Calling for CALKING LEAD ...IT PAYS!

**J**OINTS calked with lead have sufficient flexibility to absorb ground movement without damage to either pipe or joint. Also, lead calked joints may be quickly and easily repaired without interrupting the flow.

Important too, are the facts that lead joints are unaffected by thio-bacilli, are electrically conductive, and no close temperature control is required to make them. They have generations of proved performance behind them.

## LEAD

### INDUSTRIES ASSOCIATION

420 Lexington Avenue • New York 17, N. Y.

*You're money ahead when you work with lead*

#### Why lead pipe is "Tops" underground

1. *Its flexibility prevents damage from ground movement or settling.*
2. *Eliminates costly joints.*
3. *Resists corrosion.*
4. *Does not clog.*

Insist on calking lead and lead pipe which meet recognized national standards such as A.W.W.A. 7D. 1 — 1938, Federal Specification WW-P-325, Lead Industries Association Standards, or CS94-41 and CS95-41 of the National Bureau of Standards. Such lead products may be identified by this Seal stamped on them for your protection. Write for copies of these standards and specifications and for our free magazine, "Lead."

**%Proportioneers% Heavy Duty Midget Chem-O-Feeder**—the famous Little Red Pump—is the modern way to protect your water supply. If you are plagued with the spectre of dangerous undertreatment, or are worried about the bad taste and expense resulting from wasteful overtreatment, let the Little Red Pump solve your problem. This inexpensive pump feeds all water treating chemicals with enduring accuracy; its design is up-to-date with the See-Thru plastic pump head to clearly show the action of the check valves and the flow of the liquid. Feeding rate is readily adjustable—the pump does not require an expert operator.

Over 18,000 installations of **%Proportioneers%** are establishing records for dependable, precise chemical feeding. Let us know your requirements.

(Continued from page 6)

**Robert C. Ratcliffe**, Office Engineer, Bureau of Reclamation, Cheyenne, Wyo., died on August 16 at the age of 42.

Mr. Ratcliffe was born in Louisiana and grew up in Colorado, working his way through college there and gaining a B.S.C.E. in 1927. After a number of years' experience in the highway departments of Iowa, Wyoming and Colorado he was appointed Chief of the Department of Public Works at Grand Junction, Colo. Part of his duties there were as director of engineering, construction and maintenance of the water and sewerage systems.

In 1940 and 1941 Mr. Ratcliffe was engaged on the design of water and sewerage, among other utilities, at Fort F. E. Warren Replacement Center, the Evanston, Wyo., sewage disposal plant, and a small arms ammunition plant at Denver and he designed the sewage works at Camp Carson, Colo.

Shortly after Pearl Harbor he joined the U.S. Engineers as Associate Civil and Sanitary Engineer, and as such designed or reviewed the designs of all water and sewerage construction under the jurisdiction of the Albuquerque District Office. After the completion of the major part of the construction program he was assigned to Hobbs Army Airfield as Sanitary Engineer. He had only recently joined the Bureau of Reclamation.

**Lt. Kenneth G. Barnhill**, former Estimating San. Engr. with the Permutit Co., New York, is Post San. Officer and Asst. Post Medical Inspector at the Marianna, Fla., Army Air Field. Barnhill received a B.C.E. degree from the College of Eng., New York Univ., in 1939.

**William H. Carper**, City Mgr. of Clifton Forge, Va., for the past two years, is now an engineer on the State Planning Board of Virginia, assisting localities on planning and zoning programs and making state-wide studies of such problems. Carper was Trustee of the Virginia Sec., A.W.W.A., for the 1944-45 term. A graduate of Roanoke College, 1936, and Virginia Poly. Inst., 1938, Carper has also been City Engr. of Fredericksburg, Va., and City Mgr. of Culpeper, Va.

**Henry G. Acres**, President of H. G. Acres and Company, Consulting Engineers, Niagara Falls, Ontario, died on September 4 at the age of 65 in Toronto.

Mr. Acres was educated at the University of Toronto and first achieved professional prominence in 1905 when he put into operation the first 10,000-hp. turbine ever built. He was then Assistant Mechanical Engineer of the Canadian Niagara Power Co. Two years later he was in charge of the construction of the first 110,000-v. transmission line ever built.

He attained the reputation as one of Canada's leading hydro-electric engineers and recently was in charge of design and supervision of the Chippawa-Queenston development of the Ontario Hydro-Electric Power Commission and the Shipshaw development of the Aluminum Company of Canada at Arvida, Que. The 1,200,000-hp. Shipshaw project, largest localized power development in the world, opened in November 1942.

## 100 YEARS AGO

### CEMENT-LINED PIPES FIRST USED

Although Europe introduced the initial use of cement lining for pipes, America was not far behind . . . because in the year 1845 a cement-lined pipe was laid in Jersey City, New Jersey.

Over a century ago the French Academy of Science went on record with the following statement: "Hydraulic cement is, of all the compositions combining facility of application with cheapness, that which adheres best to castings, is most indestructible, and prevents most effectually all oxidation (corrosion) and consequent formation of tubercles."

Since then these findings have been proven over and over again—especially by the Centrline method of placing cement linings in

water supply lines of large and small diameter.

The Centrline process consists of first cleaning the main and then applying by centrifugal force, a dense cement mortar lining of required thickness, mechanically troweled to a smooth finish "in situ". During long years of experience Centrline has lined and reconditioned pipe-lines of every age, varying in diameters from 30" to 90", and have increased the sustained carrying capacity for tuberculating waters from 20% to 100%. Wherever your pipe is situated, whatever

its age, whatever its length—if its diameter is 30" or more—Centrline men and equipment can quickly reach and recondition it with a sleek, new cement lining.

**E. J. Hood**, former Supt. of the 9-mgd. filter plant of the Central Power & Light Co., Laredo, Tex., has accepted an appointment as Asst. San. Engr. in the Sanitation Div. of the Houston, Tex., Water Dept. He is supervising main sterilization, cross-connections, sample collection, etc.

Hood was first engaged at the experimental water clarification plant in Austin, Tex., in 1924 and transferred to the new filter plant there the next year. In 1927 he took charge of the rapid sand filter plant at Nuevo Laredo, Tamps, Mexico, and remained there until joining the Laredo, Tex., company in 1932. Hood received a B.S. degree at the Univ. of Texas in 1926.

**Jess B. Johnson** transferred on August 1 from the Sturgeon Bay, Wis., Utilities, with which he had been associated for fifteen years, to the Hartford, Wis., Utilities, where he has accepted the post of Supt. and Engr. He is in charge of water, electricity, central heating and sewage treatment. Postwar plans for the utility include doubling the generating capacity and relieving an extreme water shortage. The water is at present obtained from wells outside of the city.

(Continued on page 18)

## Ringstyle

The Ford RINGSTYLE Valve is an inverted key angle valve with meter coupling nut attached. For pit settings where meter is set on risers it makes a most convenient and satisfactory curb valve. Hundreds of thousands in service. Write for catalog and further information.

# THERE'S A STRING OF THEM NOW

## ACROSS THE COUNTRY

**Producing Clear, Soft, Iron-Free  
Water for Many Municipalities**

When it's reconversion time, there will be new materials, methods and ideas to be developed and perfected and molded into useful equipment . . . equipment which eventually will find application in important beneficial public works improvements.

In the Water Conditioning Field, however, there is no need to wait for this "miracle" equipment to materialize because

ACCELATORS had already gone through the developing and trying-out stage before the war. There's a string of municipal Accelator installations across the country now

ACCELATORS are doing a lot of different things for a lot of different kinds of water . . . clarifying . . . softening . . . stabilizing . . . removing color . . . taking out iron.

Results are always excellent . . . frequently remarkable.

You can't beat ACCELATORS for Performance and Economy. Would you like Bulletin 1824?

*it's Post War now*  
**For Mathieson's Sodium Chlorite  
 and its Co-Product, Chlorine Dioxide**

YES—through the ingenuity of Mathieson's chemical engineers, the available supply of Sodium Chlorite (and its amazingly useful co-product, Chlorine Dioxide) has been stepped-up to totals almost as great as originally planned for post war!

In simplest terms, this means that this most versatile — under certain conditions most powerful and under other specific conditions most gentle — oxidizing agent yet developed is available now. To many phases of American industry and to hundreds of communities beset with taste and odor problems in their water supply systems — this announcement will be of outstanding significance.

The adoption of Sodium Chlorite and Chlorine Dioxide in the technique of bleaching is certain to re-

sult in improved quality of many products now bleached by older methods. Textiles — cotton, rayon, and nylon . . . paper products of all kinds . . . edible and inedible oils . . . shellacs and varnishes . . . even beeswax and straw products, can be bleached *whiter* than ever before with an absolute minimum change of chemical and physical characteristics through the use of Sodium Chlorite. And Mathieson's research staff is still developing more and more uses for this greatest of oxidizing agents!

Mathieson is prepared to furnish full information on Sodium Chlorite — and Mathieson's staff is ready to work with you now in adapting this outstanding chemical to your requirements. Write today!

# STOP FISH

## BY ELECTRONICS

This patented fish control method employs modern electronics in overcoming a serious operating and maintenance problem. Fish of all sizes are kept at a *safe distance* from intake structures, or screens, by the use of an Electronic Control Unit. This equipment, generating special electrical impulses, energizes an electrode system designed and engineered for your particular fish control problem.

The Burkey Electric Fish Screen has been thoroughly proven through years of service in Condensing Water Intakes, Hydroelectric Plants, Water Systems and Industrial Pumping Installations.

# HYDRO-TITE

## AND DRY BRAIDED FIBREX

**A DEPENDABLE SELF-CAULKING JOINT COMPOUND FOR CAST IRON BELL AND SPIGOT WATER MAINS**

**HYDRO-TITE** is a self-caulking sulphur base jointing compound used to joint bell and spigot cast iron water mains and soil pipe. It comes in powder form which insures uniformity and quick melting.

When poured into a joint, **HYDRO-TITE** immediately solidifies upon contact with the metal and bonds to both the surfaces of the bell and the spigot for the entire depth of the joint. It requires no caulking and after pouring a joint, water pressure may be immediately applied.

**HYDRO-TITE** is easy to use, no skill being required to make joints that are tight from the start. Joints made with **HYDRO-TITE** will stand any pressure the pipe will stand.

### DRY BRAIDED FIBREX

**USED LIKE BRAIDED JUTE WILL NOT BREED BACTERIA**

**A SANITARY** Packing used in jointing bell and spigot pipe for water, sewer mains and soil pipe.

**FIBREX** was designed for use with Hydro-Tite and other self-caulking compounds, but is entirely suitable also for joints made with lead, and for Sani-Tite and other asphalt sewer joint compounds. Thousands of pounds of Fibrex are already in service on water lines throughout the country.

## Reprints Available

**Recovery of Calcium Carbonate or Lime From Water Softening Sludges.** By Robert T. Sheen and Herbert B. Lammers.

**Calcining Sludge From a Softening Plant.** By H. V. Pedersen.

**Calcining Sludge From a Water Softening Plant.** By C. W. Gordon.

**Recalcination of Water Softening Sludge.** By F. G. Nelson.

The first two articles describe original projects for the recovery of calcium carbonate from sludge, profusely annotated with illustrations and tables; Sheen and Lammers describe work at the Wright Aeronautical Corp. and the Columbia Steel Corp., while Pedersen explains his project on a consumers' supply at Marshalltown, Iowa. The Gordon paper discusses some of the methods used by Pedersen and the Nelson paper presents supplementary data relative to the Pedersen experiments and contributes information about two other recalcination projects. **Under one cover—35c**

**GET READY NOW—  
TO LAY PIPE FAST**

**ALCO ELECTRIC-  
WELDED STEEL PIPE**  
**is the Pipe to Lay**

ALCO ELECTRIC-WELDED STEEL PIPE is extensively used and extremely popular. And for good, solid reasons!

It is strong, dependable, durable, long-lived. It is smooth, gives maximum flow and capacity. It is light in weight, easy to handle—comes in long lengths, requiring minimum joints—advantages that mean faster, lower-cost installations.

Don't wait for the postwar flurry. Plan now to use ALCO ELECTRIC-WELDED STEEL PIPE for water, sewer, gas and oil lines. Now is the time to get ready. Tell us your requirements and let us help you.

## NOW IS THE TIME To Start Your Water Expansion Program

Most of Layne's war work has been completed and more and more time is now being given to Well and Pump installations for cities and towns. Water expansion plans can now be pushed to completion.

Essential materials are becoming available in increased quantities. Crews are up to full strength. A full range of sizes in Layne Pumps is now being built.

If your city needs more water for population or industrial expansion, Layne engineers can extend valuable aid. Write for further details, catalogs, bulletins, etc.

# Optimum pH

## *was a problem in Oklahoma City*

Note the past tense—it *was* a problem until threshold treatment with Calgon\* solved it.

Here's the story, extracted from an article by Frank S. Taylor, engineer in the Oklahoma City Water Department, read before the Southwest Section AWWA Conference.

Softening of the Oklahoma City water supply greatly reduced the formation of scale in hot water heater coils but a problem soon arose due to corrosion of the galvanized hot water tanks which had formerly been protected by this same scale formation. In addition there were complaints due to corrosion and consequent "red water" in all the dead ends and even in some of the circulating lines.

Raising the pH proved of little benefit and caused trouble due to clogging of meters. In addition,

much of the calcium carbonate that was precipitated came down as a loose sludge instead of a protective scale on the pipe walls. This sloughed off frequently to cause more complaints of dirty water.

Feeding Calgon to the filtered water effluent put an end to the difficulty. Meters gave trouble for about three months, as accumulated sludge and scale were gradually eliminated, but since that time meter trouble has been below average.

Customers have been well pleased with results, and the water department has been able to discontinue flushing of dead ends, which, previous to Calgon treatment, had to be done every week.

The cost of this Calgon treatment has been very small and the benefits large.

*\*Calgon is the registered trade-mark of Calgon, Inc., for its glassy sodium phosphate products.*

## BITUMASTIC IS STANDARD PROTECTION FOR WATER TANKS

Bitumastic coatings provide long-time, maximum corrosion protection for your water and sewage plant equipment. When used for standard maintenance, metal surfaces *stay* in good condition. When used for reconditioning and salvaging, *new service life* is assured for old equipment.

For example, cost of a new standpipe was saved at the Bogota Water Company at Bogota, N. J., when a 30-year-old water tank was reconditioned and then coated with Bitumastic protective coatings. One coat of Bitumastic Priming Solution and one of Bitumastic Enamel were applied to the interior surfaces of sides, bottom, and pipe connections.

You will find Bitumastic Enamel also gives similar long time protection for water works and sewer pipe lines.

## How to Control Sump Pump Discharge

The plant sewer lines drain into the sump where the waste is pumped into the concrete separators through R-S Valves Nos. 1 and 2. Valve 3 in the connecting line provides a means of cleaning either A or B separators, as the  $\frac{3}{4}$ -inch syphon breakers can be plugged with corks and the fluid syphoned from the separators to facilitate cleaning operations. The three 16-inch, 15-pound valves have 25-pound American Standard flanged drilling and are hand lever operated. Easily adapted to power operation.

For fast, easy control and shut-off of volume and pressure, the R-S Butterfly Valve has no equal.

Prompt quotation furnished on receipt of installation data. Write for Catalog No. 14-B.

**WESTERN PENNSYLVANIA SECTION MEETING**

The Western Pennsylvania Section, co-operating with the Western Pennsylvania Water Works Operators, held its Sixth Annual Meeting at Pittsburgh on September 14 at the Roosevelt Hotel, Pittsburgh. Last year's meeting had been canceled because of wartime conditions.

One hundred twenty-five persons were registered by the time the first paper was read. The total registration was 150, but there were probably fifteen or twenty persons who attended the afternoon session but failed to sign up due to the fact that registration for the meeting entailed no charge.

The intent of the program of this meeting was to cover the various phases of water works operation, such as "Management," "Operating Problems," and "Physical Factors Causing the Major Operating Problems."

In "Baffling Sedimentation Basins," R. W. Hayden and W. J. Murdoch showed that even a sedimentation basin designed according to some of the best laws of hydraulics may not necessarily give a satisfactory settled water.

# DORR *Clarifiers . . .*

Dorr Clarifiers and  
Flocculators at Cov-  
ington, Ky., Water  
Treatment Plant

## CONSTRUCTION

- **Symmetrical Shape** — (Round or square.) Less form work required.
- **Less Concrete and Steel Used** — Thinner tank walls for circular tanks possible, less reinforcing steel needed — because all stresses are tensile.
- **Simple Tank Work** — No complicated fillers, beams, columns or slab work are used.
- **Simple Overflow** — Tank side forms one side of overflow trough; trough and tank poured as monolithic unit.

## OPERATION

- **No Standby Units** — (Except for additional capacity.) Virtually no possibility of mechanical breakage below water line, where dewatering would be necessary to make repairs.
- **Low Power Consumption** — Only 60 to 70% of motor's rated horsepower used for operation. Full power used only to overcome starting torque.
- **Efficient Removal** — Because of location of the weir giving maximum length, efficiency of removal is greater than other types with less weir lengths.
- **Low Maintenance** — Practically no parts to get out of order or require replacement. Drive unit immersed in oil and encased in weatherproof housing.

Dorr Clarifiers are available in two main designs, circular and square. A square top, round bottom type is also available, as well as a unit for installation in rectangular tanks. Sizes range from 10' to 200' in diameter and in capacities from 0.03 to 35 MGD.

**proved sound from**

*Either Angle*

Several hundred installations in the United States and thirteen foreign countries attest to the efficacy and popularity of Dorr Clarifiers for the pre-treatment of water prior to filtration. Dorr Clarifiers have demonstrated their value in water treatment (1) for the pre-sedimentation of turbid water (2) for the sedimentation of chemically flocculated water, and (3) for the sedimentation of water-softening sludge.

Here are some of the features in these many installations that have proved Dorr equipment sound from either angle—construction or operation:

7033

For complete information on Dorr Water Treatment Equipment write for Bulletin No. —6191, "Sedimentation", and Bulletin No. —6971, "Flocculation and Mixing".

*(Continued from page 44)*

"Foreman Training," as related to both employees and management, was discussed by W. B. Simpson, Hope Natural Gas Co. He brought out that all water works men have their problems in management, whether they employ three men or hundreds. The paper gave management a better outlook on the employee's side of the picture.

The Pollution Control Program of the Pennsylvania State Dept. of Health was thoroughly discussed by such outstanding members of the Pennsylvania Sanitary Water Board as E. A. Holbrook and J. R. Hoffert. C. H. Young and L. S. Morgan, Dist. Engrs. for the State Dept. of Health, brought out the problems involved and described many of the things which the state has done to correct some of the pollution difficulties.

"Raw Water Quality" on the major streams furnishing water to the Western Pennsylvania area was covered by C. F. Drake, F. W. Bouson, B. French Johnson and A. R. Todd.

"Problems in Bacteriology," as presented by Marie A. Murphy, Pittsburgh, and discussed by C. K. Calvert, Indianapolis, Ind., and Professor Harold G. Lang, Carnegie Inst. of Technology, was of particular interest to the chemists and bacteriologists present.

"Determining Ferric Sulfate Dosages" and "Problems in Corrosion" were handled by J. B. Nickle and H. M. Olson.

Charles L. Fox, Gen. Mgr., Pennsylvania Water Co., Wilkinsburg, Pa., was nominated for the Fuller Award, for his contribution to the solving of engineering problems of the water works profession and his untiring efforts to promote knowledge and friendship in the water works associations.

Secy. I. M. Glace, Pres. R. B. Adams, Ted H. Kain and T. G. Braman of the Pennsylvania Water Works Operators Assn. were present and participated in the meeting.

EARLE P. JOHNSON  
Secretary-Treasurer

STEAM TURBINE COMPANY · TRENTON 2, NEW JERSEY

*(Continued from page 46)*

- In the report made by Fire Comr. Patrick Walsh to Mayor La Guardia following the plane crash in the Empire State Bldg., the commissioner suggested that "some form of modified fire drill" be held for tenants of skyscrapers and that federal agencies agree on a rule barring air travel over congested sections of the city. In addition he strongly recommended that the city building code be revised to bar cross-sections or other vital parts of a standpipe or sprinkler system in buildings from passing through long shafts where they can be broken by falling debris. Walsh stressed this point because a main 8-in. standpipe was snapped by parts of the
- falling plane in the fire tower shaft on the 54th floor of the building. This additional accident greatly impeded the work of the firemen, although both water supply and discipline were excellent, and all fires were extinguished within 40 minutes of the accident. As is generally known, an army bomber had crashed into the 79th floor, and flames from burning gasoline swept ten stories and took fourteen lives.

**The Chicago Bridge & Iron Co.** has opened a new sales office in Atlanta, Ga. H. F. Stearns heads the new branch, which is located in the Healey Bldg.

**The North Dakota Water and Sewage Works Conference** will be held on November 8 and 9 after all, according to its Executive Committee. It had previously been canceled due to war conditions. The meeting will convene at the Gardner Hotel, Fargo, N.D.

**Hearings on the Murray Missouri Valley Authority Bill** were opened in Washington on September 18, when the Senate Irrigation and Reclamation Subcommittee heard arguments from reclamation interests in the West and from the governors of the ten states affected. The Senate Commerce Committee had previously made an adverse report on the navigation features of the bill. A later hearing will be held by the Senate Agriculture Subcommittee.

The joint Army Engineers-Reclamation Bureau group, on the other hand, has been making rapid progress on its detailed plans for the development of the Missouri's water resources. The inter-agency committee carries field representatives of the War Dept. Engrs., Interior and Agriculture Depts. and Federal Power Com., as well as four representatives of the ten governors. The plans will be acted on as soon as Congress appropriates funds. The plans are compiled under the omnibus 1944 Flood Control Act and without intervention of any regional corporate agency of the Authority type.

**SPACE SAVINGS** are often obtained by installing Cabinetrol as part of a wall. This unit, in a pumping plant, controls low-voltage power for lighting and auxiliaries. Ready accessibility is a feature of Cabinetrol which results in important maintenance savings. Hinged doors, front and back, permit easy access, and they can be locked.

**CENTRALIZATION OF CONTROL**, with a pre-engineered Cabinetrol layout like this, simplifies plant operations, gives greater assurance of service continuity, and harmonizes in appearance with other modern equipment.

Buy all the BONDS you can  
—and keep all you buy

**Co-ordinated  
WATER PLANT  
ELECTRIFICATION**

# control NO EXTRA COST!

## STYLED FOR TOMORROW

this main operating panel, made up of 16 Limitamp controllers, is installed in a pumping plant. With Limitamp control, fault current is cut off before any short has time to harm contactor or motor.

**A G-E metal-enclosed control system  
will enhance the looks of your plant  
and give you time-saving centralized control**

"A BEAUTIFUL layout, but it must have cost plenty!" If that's your impression, may we point out—

—that the Cabinetrol layout that you see opposite actually cost less than a comparable, made-up assortment of individual controls would have cost. It cost less *initially*. It is costing less to operate and *maintain*. The Limitamp control panels above offer similar economy for high-voltage drives.

The savings in installation cost that you get with a pre-engineered G-E metal-enclosed control will usually far outweigh its higher cost. It is delivered completely wired and ready to install as a unit. No racks to build. No waiting to accumulate a lot of different components.

Metal-enclosed control is inherently safer and easier to maintain. Each controller is segregated in its own individual compartment so that it can be serviced separately. Interlocks prevent accidental opening of doors on live starters.

To save time and make the most of G-E metal-enclosed control, pump motors, and other equipment, let us start now to work with you and your consultants. By calling us in before your plans are "set," you will wind up with co-ordinated architectural and electrical plans that will assure less costly construction and a plant that will stay modern longer. General Electric Company, Schenectady 5, N. Y.

**GENERAL  ELECTRIC**  
100-111-1000

(Continued from page 50)

**"Recent experience in the operation of public water supplies,"** says *Health News*, weekly bulletin of the New York State Dept. of Health, "indicates a definite need for closer co-operation between local water supply officials, health officers and district sanitary engineers in developing programs for expeditious handling of emergencies and other problems of mutual concern."

Emergencies, resulting from floods, sudden leakages in supply conduits, etc., have not been handled entirely satisfactorily and the Department of Health has issued the following recommended outline of policy.

Basic responsibility for effective supervision and operation to assure delivery of water of safe sanitary quality rests with the owner of a public water supply system. Court decisions have established that a municipality, water company or any owner of a public water supply system may be held responsible for damages which may accrue through negligence proved in a court of record. The city of Olean, for instance, was sued by citizens who contracted water-borne typhoid fever as a result of negligence on the part of city officials.

The New York municipal, village and town laws contain definite provisions regarding the duties and responsibilities of water supply officials in the operation of publicly owned water supply systems. Furthermore the State Sanitary Code charges the owner of a public water supply with responsibility for compliance with the requirements of the Code, irrespective of the type of ownership of the supply. Court decisions have established the necessity of exercising due diligence in operating public water supply systems so as to assure the delivery of water of safe sanitary quality and also the right to collect for damages when negligence has been proved.

In general, it is the duty of the local health officer, under normal conditions, to satisfy himself that water of safe bacterial quality is furnished to consumers and, during periods of emergency, to exercise his influence through official action in the interests of the public health.

The Public Health Law and the State Sanitary Code give the local health officer or board of health ample power to take such steps as may be necessary to protect the health of the public under their jurisdiction.

The district engineers of the Division of Sanitation are available as advisers to boards of health and water supply officials. . . . Water supply officials should plan also for the utilization of facilities made available under the Mutual Aid Program through zone co-ordinators and through the district engineers who are also assistant zone co-ordinators.

**"Armco Products for Engineering Construction"** is a collection of twenty bulletins under one cover, recently issued by Armco Drainage & Metal Products, Inc., Middletown, Ohio, from which the book may be obtained on request. A special index co-ordinates "Kind of Construction" with "Suggested Products." Under the second heading appear the numbers of the bulletins in which the suggested products are described. Fourteen "Kinds of Construction" directly relate to water supply and sewage treatment. Photographs, cross-sections and tabular specifications are included.

(Continued from page 54)

**The Vogt Bros. Mfg. Co.** was awarded the Army-Navy "E" on July 27. The Vogt Bros. have been producing war material for the Army and Navy since 1940. Their present production includes water works equipment for the Army, Navy and Maritime Com., field bake ovens and accessories for the Army, rocket gun nozzles for the Navy and a series of miscellaneous items for the Engineer Corps and the Army Air Force.

The Vogt Bros. Co. has been in continuous operation since 1915, and is successor to an organization originally established in 1833. Ernest L. and Alvin Vogt are at present the active managers of the firm. Another brother, Clarence, is now serving in the Army as a colonel in the Ordnance Branch. Adam Vogt, founder of the present company, recently retired.

**"Water,"** house organ of the American Water Works & Electric Co., recently described a fire in a tar-papered wooden chlorine house at its Missouri Ridge Reservoir, Chattanooga, Tenn., City Water Co. The fire was started by stray flinders from a stack of burning weeds nearby. The chlorine house was leveled to the ground and four cylinder fuse plugs were melted by the heat. One 110-lb. cylinder rolled down a  $2\frac{1}{2}$ -ft. slope where it struck a 4-in. cast-iron valve box. Fragments of the valve box scattered over the vicinity and the cylinder flew through the air to strike a house 200 yd. away. Another cylinder, full of chlorine, was broken and the gas turned all the nearby growing green things brown, and injured two firemen who inhaled it. The fire brigade was too late to stem the fire.

**Several outbreaks of gastro-enteritis in New York State** in 1945 have been traced to improper refrigeration of cream-filled pastries, according to *Health News*, weekly bulletin of the New York State Dept. of Health. One of the most severe outbreaks resulted when a baker, just recovered from an upper respiratory infection and sore throat, allowed cream filling which he had prepared to stand at room temperature for 24 hours. Approximately 100 cases, one resulting in death, occurred in one city when chocolate eclairs and cream puffs were not properly refrigerated. Says *Health News*:

The recurrence of epidemics of this type justifies re-emphasis of certain precautions which should be strictly observed in the preparation, handling and storage of cream-filled foods. The personal hygiene of the bakers and all others who handle such products should be beyond question. No person with lesions such as boils or sores on his hands or forearms, or with sore throat or sinus infection, should be permitted to engage in their preparation. To avoid bacterial growth, custard filling should be used soon after preparation and not held without refrigeration for any considerable length of time before the shells are filled. If possible, the pastry should be rebaked after filling. All cream-filled products should be eaten soon after they have been prepared and in the meantime should be stored in a refrigerator, never in a warm room.

## NEWS OF THE FIELD

**The American Water Works Association**, in adopting its Code of Practice, manifested a fully reasonable attitude in its expressions relating to the rights of the public to water service. The closing paragraph of the code reads:

"I shall not, as an incident related to discussions of rates of pay or conditions of employment, suspend or fail to perform the duties entrusted to me, nor permit water service to fail the citizens who depend on me. I shall, having associated myself with public water supply operations, hold the public interest superior to my personal interests and I shall by my acts and by my leadership see to it that water service is maintained under both normal and emergency conditions."

These words have a meaning which greatly needs wider recognition as a general policy. Since active combat ceased in Europe and the Pacific, reconversion has been retarded by a series of civil conflicts presumably initiated in the interest of Labor.

While it would appear to be completely civilized for procedures to be set up to adjudicate peaceably the differences of opinion between employers and employed, for reasons largely political and opportunistic much of our recent national labor legislation appears to make the way easier for open conflicts, which we call strikes. For centuries courts of law have existed whose duty it was to adjudicate differences of opinion in civil matters. Persons who felt themselves injured filed suit against those who had damaged them. Fortunately we have not set these practices aside by legislation which tells the litigant that, if he does not like the court's decision, he can start his own private war against his opponent.

The American Water Works Association has shown that it considers the right of the public to water service is superior to any other interest which affects operations. Strictly speaking the same attitude must be carried forward into every level of employment in any service industry which by its size or lack of competition is essential to the life and work of those who use the service.

It is this idea of the essentiality of certain services to civilized ex-

*(Continued on page 2)*

*(Continued from page 1)*

istence which is implicit in the legislation proposed by Senators Ball and Hatch along with former Senator, now Justice, Burton. This bill (S1171) contains a section which confers upon the proposed Labor Relations Board power "to require the parties to accept temporarily a compulsory settlement of their labor relations controversy so as to avoid any interruption to the supply of a commodity or to a service on which the community affected is so dependent that a severe hardship would be inflicted on a substantial number of persons by either a brief or prolonged depreciation of such commodity or service. The Board is authorized and directed to find that severe hardship would be so inflicted in case of any serious or protracted interruption of a *public utility* or other public service, or of the service of an essential food such as milk, or of the supply of an essential fuel such as coal or oil, or in case of any serious or protracted interruption in any other supply or service on the continuity of which the health, safety or welfare of a community depends."

Arbitration of labor conflicts in these fields is made compulsory by the terms of the bill. It is a vital piece of legislation and one to which much opposition has been expressed by labor leaders who prefer the present situation.

It is in complete accord with the A.W.W.A. Code of Practice. No wiser thing could be done by any member of this Association than to write his Senator or Congressman and express support of such a law. Without such control upon the parties in labor controversies, life in this country cannot go on upon the production level of which it is capable.

Every water works executive and every responsible water works employee has one prime objective—to give the public the service which it needs and expects. Within that basic framework all of us look forward to the development of methods by which both water works labor and water works management will receive full recompense for the work that is done. It is a fair attitude, an equitable attitude and this Association can be proud that it has made its position plain.

Deep-Well  
Turbine  
Pumps

**N**INETEEN major cities throughout the United States . . . from New York to California . . . now have higher carrying capacity in their important water supply lines—as a result of the Centriline process of reconditioning 29 installations—totaling almost a half-million feet of age-old pipelines.

Through the Centriline method of first cleaning the main and then applying by centrifugal force a thin protective inner lining of cement mortar the original carrying capacity of these important pipelines was restored. Not only was there an increase in the amount of water delivered, but also depreciation and pumping costs were cut to a minimum.

If tuberculation has invaded your water system lines—it's high time to CENTRILINE . . . and eliminate future depreciation costs and pumping expenditures. Wherever your pipeline is situated—whatever its length—if its diameter is 30" or more—Centriline men and Centriline equipment can quickly reach and recondition it.

The Centriline process is a rapid and economical method of reconditioning pipelines. It consists of first cleaning the main, then applying by centrifugal force, a dense cement mortar lining of required thickness, mechanically troweled to a smooth finish. This is done underground, in place.

**Frank Gifford**, 67, Secretary of the New England Water Works Association since January 1920, died suddenly on October 5 at his home in Plaistow, N.H. He had been in ill health for the past year and had tendered his resignation to the Association on the previous day, contingent upon the appointment of a successor.

Gifford was born and educated in Fall River, Mass., and worked in the water department there until he resigned in 1915 with the title of Assistant Superintendent. He went from there to the Dedham, Mass., Water Co., of which he was Manager upon his retirement eight years ago. Since then he had engaged in private practice as a public utility consultant. He was also President of the Garden Hose Spray Co., Cambridge, Mass.

In his mature years Gifford took up the study of public utility law and was graduated from the Suffolk Law School in 1930. In November 1944 he was elected to the New Hampshire State Legislature.

### *A.W.W.A. Members in Service or Their Friends . . .*

The Board of Directors of the A.W.W.A. has ruled that no member who has been in service shall be dropped from membership because of non-payment of dues while he was in service. This information has been printed on the bills for dues for the past three years. Many members in service have filed information concerning their status with the A.W.W.A. Many known to be in service have not, but their names have been carried on a "suspense" list until information is received that they have returned to civilian status.

There is good reason to believe that some members who have been in service have not notified the A.W.W.A. and have been dropped for non-payment of dues. If anyone knows of such an instance and will advise the A.W.W.A. headquarters office, steps will be taken immediately to correct the situation. The A.W.W.A. wishes to co-operate fully with every serviceman. Will you help?

(Continued from page 8)

When Major General George C. Dunham, President of the Institute of Inter-American Affairs and Deputy Director of the Office of Inter-American Affairs, was succeeded by Col. Harold B. Gotaas in September, he was eulogized by Wallace K. Harrison, Director of the Institute, in the following terms:

"The wartime efforts of General Dunham and his colleagues in building hemisphere defenses against disease and hunger entitle him to a place of honor alongside the other great medical figures of the Americas—Walter Reed, William Crawford Gorgas, Carlos Finlay, Oswaldo Cruz and Carlos Chagas.

"Under his able direction, co-operative inter-American health and food programs have been established by agreement with eighteen of the other American republics. Such programs have made possible the development of health centers, anti-malarial projects and food supply programs for the benefit of rubber workers, miners, farmers and the Armed Forces of the United Nations."

General Dunham is known as the "flying doctor of the Americas," because of his annual average of 100,000 mi. of air travel to visit more

## Prevent Rusting

Rusta Restor cathodic protection, provides permanent protection against rusting of water tanks, piping and steel structures of all kinds.

Initial cost of a complete equipment is about equal to the cost of a good paint job. . . . Operation costs only about 2 mills (i. e. \$0.002) per year per square foot of surface protected.

If your tanks and steel structures are not now protected by this proven low cost method, they should be. No obligation. Send for fully descriptive literature today.

produce and consume and to raise their standard of living. This brings better national economy and sounder international trade."

Colonel Gotaas was born in Mellette, S.D., in 1906, and holds civil engineering degrees from the Univ. of South Dakota and from Iowa State College at Ames and he has received a doctor's degree in San. and Public Health Eng. from Harvard Univ. Before joining the Army in 1942 he was Professor of Public Health Eng. at the North Carolina Graduate School of Public Health, Chapel Hill. Bolivia and Chile have decorated him for his services in inter-American affairs.

**News hot off the wires** in a recent edition of the *New York Sun* was headed "Fire Hazard in 1686 Met With Buckets." The story in its entirety read:

By 1686 the fire hazard of New York City had become such a problem the city fathers ordered every citizen having two chimneys on his house to have at least one fire bucket near at hand. If he had more than two chimneys he must have two buckets. Every baker and brewer must have six fire buckets filled with water at all times or be fined six shillings.

## You'll profit with this STEEL PIPE for your new lines

Now that you are planning those war-postponed improvements for your waterworks systems, it will pay you to consider the many practical advantages of ARMCO Spiral Welded Steel Pipe.

When your waterworks system is designed to take full advantage of the features of ARMCO Steel Pipe, you can be sure of economical and efficient operation.

ARMCO Steel Pipe is easy to install and skilled labor is unnecessary. Fifty-foot lengths mean fewer joints, less assembly work. A spun-enamel lining assures high flow capacity, prevents tuberculation and

recurrent cleaning troubles. Shattering or sudden breaks are no worry with "Spiral Welded." Sizes range from 6" to 36", with wall thicknesses to meet requirements.

See for yourself how you can save time and money by putting these advantages to work. For information about ARMCO Steel Pipe, just address Armco Drainage & Metal Products, Inc., Welded Pipe Sales Division, 2411 Curtis Street, Middletown, Ohio.

# SOLVING THE PROBLEMS OF PROBLEM WATERS!

**Boiler  
Inefficiency**

**Heat  
Loss**

**Processing  
Troubles**

## REFINITE Water Refining Equipment

For every industrial process, for every institution, industrial plant or municipality . . . anywhere water is used, there is a REFINITE product to meet the need for water refining. For over a quarter of a century Refinite engineers and laboratory experts have solved the problems of problem waters for plants across the country. Refinite sales engineers throughout the country are ready to help you with any water problem. Write today, there's no obligation.

**The Refinite Corporation**

102 Refinite Bldg.

Omaha, Nebraska

**FOR EXCELLENCE IN PRODUCTION**

(Continued from page 18)

Accurate records of each length of hose, with date of purchase, dealer, brand, dates and results of tests and any unusual characteristics or repairs.

The foregoing tips are briefed from a pamphlet issued by the B. F. Goodrich Co., Akron, Ohio.

**A working model of a chlorine-alkali plant** in actual operation has been donated by the Pennsylvania Salt Mfg. Co. to the Franklin Institute in Philadelphia, where it is on display, and a twelve-page pamphlet entitled "Salt of the Earth," describing the model, is being distributed by the company. The center spread is a photographic keyed illustration of the model, and graphic sections appear on the other pages of the booklet, helping to clarify the descriptions of the various processes. A three-dimensional model of the chlorine atom is included in the Franklin Institute display, and "Salt of the Earth" shows some of the current conceptions and the origin of the chemical and physical properties peculiar to this element.

"Salt of the Earth" may be obtained upon request from the Pennsylvania Salt Mfg. Co., 1,000 Widener Bldg., Philadelphia 7.

(Continued on page 22)

## A MESSAGE TO WATER WORKS OFFICIALS...

No peacetime industry has escaped the consequences of total war. Dislocations, restrictions, emergency regulations, shortages in labor and supplies, etc., have hampered operations for all, some suffering more severely than others.

As a result of war contingencies during these past few years which have been so hectic, the American Norit Co., Inc., has been forced to severely curtail its production of water carbons. It is hoped, however, that full scale production can be resumed soon, enabling us to meet all demands for NORIT with the same promptness as before the war.

## DOWN BELOW LEAD SERVICES RATE HIGH

**L**EAD pipe's flexibility prevents damage by ground movement or settlement and eliminates many joints. Thick walls of corrosion-resistant lead result in great durability and freedom from clogging.

That's why wise engineers reduce long-term costs by using lead services. Lead's additional first cost is infinitesimal when all the costs of installing any kind of service — paving, trenching, backfilling and so on — are considered.

Insist on lead pipe and calking lead meeting recognized national standards such as Federal Specification WW-P-325, Lead Industries Association Standards, or CS94-41 and CS95-41 of the National Bureau of Standards. Such lead products may be identified by this Seal stamped on them for your protection. Write us for copies of these standards and specifications and for our free magazine, "Lead."

### Why they keep calling for calking lead:

1. Flexible joints take up ground movement without damage to pipe or joints.
2. Quickly repaired by simple recalking without interruption to flow.
3. Generations of proved performance.
4. No close temperature control needed.

# LEAD

## INDUSTRIES ASSOCIATION

420 Lexington Avenue • New York 17, N. Y.

*You're money ahead when you work with lead*

(Continued from page 20)

**The Johns-Manville Corp.** is planning a new research center of six buildings on a 93-acre plot near Bound Brook, N.J., as the first project in a \$40,000,000 postwar expansion program. The program is expected to provide 25 per cent more jobs than were formerly available in the company's most successful prewar year.

The research center will provide "experimental factories" and pilot plants for the speeding-up of materials development. There will be a research laboratory and administration building, two combination laboratory-factory buildings, a research engineering and machine shop building, a water filtration and waste processing building and a garage and stores building. Each of the combination laboratory and experimental factory units will be staffed by a worker-scientist team, whose mission will be to solve some special building materials or industrial products development problem. Experimental manufacturing research work will be carried on adjacent to the laboratories. Experimental manufacturing work on such products as asbestos-cement pipe, asbestos shingles, asbestos wall boards, etc., will be done simultaneously with laboratory research and on semi-large-scale or full-size equipment, because the durable properties of these

## CAST IRON PIPE

SERVES FOR CENTURIES

**C**ast iron pipe foundries, having broken all pipe production records for war requirements, are now producing pipe for civilian needs. These foundries, with increased facilities, are equipped to supply the vast tonnage which will be required by war-deferred water works construction. Meanwhile, pipe is obtainable in growing volume and is becoming increasingly available, month by month. Cast Iron Pipe Research Association, Thomas F. Wolfe, Research Engineer, Peoples Gas Building, Chicago 3, Illinois.

*(Continued from page 22)*

products depend as much upon how the ingredients are mechanically put together as they do upon the ingredients themselves.

There will be a glass-enclosed promenade down the center of the laboratory building, from which the building's chief research scientist will be able to keep under observation at all times the simultaneous operations of the various worker-scientist teams.

### MINNESOTA SECTION REGIONAL MEETINGS

The cessation of the war came so close to the previously-chosen meeting dates that it was not practical to cancel the already scheduled regional meetings and replan for a Section Meeting. Therefore, the Minnesota Section held these meetings: one at Mankato, Minn., on September 11; one at Fargo, N.D., on September 14; and one at Duluth, Minn., on September 18. The total registration of 157 was much greater than had been hoped for. President L. N. Thompson, H. S. Grove, Minnesota Director, A. M. Kircher, Section Chairman, and two or more trustees were able to be present at each meeting. The programs were planned so as to cover the problem of most importance in the vicinity of each meeting.

At Mankato a paper was given by W. J. Bell, Wallace & Tiernan Co., Inc., on "Red Water—Its Cause and Cure." Bell pointed out that each supply is an individual problem and that, although the sanitary chemical analyses of two supplies might be nearly identical, different types of treatment might be needed to obtain satisfactory results.

A. M. Kircher explained some of the water problems at Mankato where the capacity of the wells had dropped as much as 90 per cent. By the discharge of heavily chlorinated water into them, the original capacity was restored to the wells.

E. M. Grime, Water Service Engr., Northern Pacific R.R., St. Paul, told of his "Difficulties With Iron in Deep Well Water Supplies" (see page 1173, this JOURNAL).

## Desperate Call!

There has been tremendous and gratifying membership response to the Association's appeal for rare numbers of the JOURNAL for war-torn libraries and for libraries cut off from communication with the "outside world" during the Occupation. The Association has now shipped overseas a number of volumes completed by the acquisition of these rare copies. This leaves the shelves empty of the following issues, which are needed to complete more sets, still needed overseas.

Vol. 31	No. 1	January 1939
	No. 3	March 1939
	No. 4	April 1939
	No. 10	October 1939
Vol. 33	No. 1	January 1941
	No. 2	February 1941
	No. 7	July 1941
Vol. 34	No. 1	January 1942
Vol. 36	No. 3	March 1944
Vol. 37	No. 2	February 1945

Won't you please go over your shelves and see if you can part with any of the above issues of the JOURNAL. If you feel that you can, send them, but *only* them, immediately to the American Water Works Association, Inc., 500 Fifth Ave., New York 18, N.Y. Receipt will be acknowledged by a check in payment, to the amount of \$.50 per copy.

**DO NOT SEND COMPLETE VOLUMES TO ASSOCIATION HEADQUARTERS.** The headquarters office has an unbalanced stock and needs certain numbers with which to complete volumes. It has no use for JOURNALS NOT listed above. If you have complete volumes of the JOURNAL which you wish to dispose of, record the fact with headquarters by letter. It may then be possible for headquarters to ask you to ship such volumes directly to a purchaser.

## FIRST IN QUALITY— Long Life and Low Operation Cost

Layne Well Water Systems and Layne Vertical Turbine Pumps are unmatched in long life and low operation cost. This means that they are a city's very best investment.

The installation of a Layne Well System involves principles developed and used exclusively by Layne—principles that invariably increase the production capacity and guarantee longer life.

Right now Layne engineers are extending aid to cities and towns that have or will soon have water development problems. Write for further information, catalogs, bulletins, etc.

**GET READY NOW—  
TO LAY PIPE FAST**

**ALCO ELECTRIC-  
WELDED STEEL PIPE  
is the Pipe to Lay**

ALCO ELECTRIC-WELDED STEEL PIPE is extensively used and extremely popular. And for good, solid reasons!

It is strong, dependable, durable, long-lived. It is smooth, gives maximum flow and capacity. It is light in weight, easy to handle—comes in long lengths, requiring minimum joints—advantages that mean faster, lower-cost installations.

Don't wait for the postwar flurry. Plan now to use ALCO ELECTRIC-WELDED STEEL PIPE for water, sewer, gas and oil lines. Now is the time to get ready. Tell us your requirements and let us help you.

# HILL-HUBBELL

## STEEL PIPE PROTECTION

### *for Permanent Installations*

HIGH  
"C"  
FACTOR

## ATTENTION

### WATER WORKS ENGINEERS

Your financial commitments will be a long term investment, if ear-marked for steel pipe and HILL-HUBBELL precision machine applied pipe protection. PROTECTED steel pipe will—

- 1—Reduce breakage and leakage, because of high tensile strength of coated wrapped and lined steel pipe.
- 2—Reduce leakage at joints, because of the coated bottle tight mechanical coupled installation.
- 3—Reduce pumping costs, because of permanent high "C" factor of alkalined steel pipe.
- 4—Reduce operating and labor costs.

The illustration is a graphic breakdown of step by step application of Hill-Hubbell Steel Pipe Protection.

"Watch Dog" models... made in standard capacities from 20 GPM up; frost-proof or split case in household sizes. All parts interchangeable with your present meters of our manufacture. Write for Bulletin.

## how to "doctor" sick water

Contaminated water streams are deadly carriers of disease-spreading bacteria . . . *sick water* that endangers the health of soldiers on fighting fronts . . . and imperils the water supply and sewage disposal systems of our industrial areas.

Today, SOLVAY Liquid Chlorine safeguards the water supply of a nation and its fighters.

Tomorrow, it will serve municipalities and industries with the benefits of wartime discoveries.

# STOP FISH

## BY ELECTRONICS

This patented fish control method employs modern electronics in overcoming a serious operating and maintenance problem. Fish of all sizes are kept at a *safe distance* from intake structures, or screens, by the use of an Electronic Control Unit. This equipment, generating special electrical impulses, energizes an electrode system designed and engineered for your particular fish control problem.

The Burkey Electric Fish Screen has been thoroughly proven through years of service in Condensing Water Intakes, Hydroelectric Plants, Water Systems and Industrial Pumping Installations.

and Management Corporation

(Continued from page 24)

At Fargo, water softening was the main topic. H. J. Sowden, Supt., Water & Light Dept., Fergus Falls, Minn., gave a paper on the softening plant there, where a raw water of from 180 to 250 ppm. alkalinity is reduced to about 70 ppm. He recommended that, when a new softening plant is installed, the alkalinity should be dropped gradually. Otherwise, bathers may suffer from intense itching if they fail to rinse off all the suds. In Fergus Falls, just this occurred and several citizens were so disturbed that it looked for a while as though there might be several damage suits brought against the city.

A report by H. H. Behlmer, Asst. Supt., Fargo Water Dept., told of postwar plans for enlargement of the plant there. The blueprints incorporate all necessary equipment for continued softening.

At Duluth, O. E. Brownell, San. Engr., Minnesota State Dept. of Health, talked on "Numerical Rating of Water Supplies." Brownell distributed a chart which showed the factors used in the rating, which, although not yet perfected, he hopes to have much improved in a year or two.

(Continued on page 44)

## **IT'S BUILDERS AGAIN!**

### **... AT MONTREAL**

In the splendid performance record of the Montreal Filtration Plant BUILDERS equipment has had an important part. Way back in 1927 thirty-two BUILDERS Venturi Effluent Rate Controllers, including Master Rate Setting, and Loss-of-Head and Rate-of-Flow Gauges, were installed. These were so satisfactory that in 1933 another sixteen BUILDERS units were added. Now in 1945, BUILDERS equipment has again been selected for the new addition to the plant, bringing the total number of BUILDERS units to sixty-four. This is just one more illustration where BUILDERS equipment is maintaining its long-established reputation for consistently reliable service. For Bulletins, address Builders-Providence, Inc., (Division of Builders Iron Foundry), 25 Coddling Street, Providence 1, R. I.

*Sincerely*

**BUILDERS-PROVIDENCE**

**FIRST AID FOR WATER MAINS!**

# Perchloron

REG. U. S. PAT. OFF.

**Instantaneous sanitizer for emergency breaks!**

The breakage of a water main at any point allows pollution to enter the water supply. Perchloron added to the water safeguards the supply by aiding in the elimination of such pollution.

Water works engineers have found Perchloron a dependable stand-by for just such emergencies because of its quick solubility, greater stability and high chlorine content.

In the water purification field, PERCHLORON is also used to sanitize small water systems, new mains, wells and swimming pools. Its properties include the oxidation of ferrous iron in water, the removal of hydrogen sulphide, the control of most types of algae and the destruction of chlorine susceptible bacteria.

PERCHLORON has been released by the military and is now available. Orders will be filled as promptly as we can meet demands.

*(Continued from page 42)*

E. C. Slagle, St. Louis County Health Dept., Duluth, spoke on the causes of epidemics and the steps necessary to correct them.

L. N. Thompson, Water Engr. and Supt., St. Paul, delivered a message on the importance of the municipal water works selling itself to the public. Needed in such a program are courtesy, not only towards the public but also within the company, and pride in water works property. Thompson suggested that signs mark the plant, buildings, etc., and that employees wear uniforms.

O. E. Brownell of the Minnesota State Board of Health was nominated for the Fuller Award for "his long and faithful service to the state as a public health engineer, his interest in advancing the profession by his work in the Water Works Operators' School, his faithful work in the Minnesota Section for years and particularly his study of steel water tank maintenance."

# ECONOMICS OF CATHODIC PROTECTION

Barrett Coal-tar Enamels, because of their resistance to moisture absorption, provide an efficient electrical insulation over long periods of time. Their high dielectric strength makes cathodic protection economical. Aware of this, engineers are today designing corrosion-proof pipelines, using protective coatings which have high electrical insulation values and require less current and equipment to make cathodic protection economical. Over a period of many years Barrett Coal-tar Enamels have demonstrated their ability to resist electro-chemical corrosion, because of their inherent insulation value.

*(Continued from page 44)***ROCKY MOUNTAIN SECTION MEETING**

The nineteenth annual meeting of the Rocky Mountain Section was held in the Shirley Savoy Hotel, Denver, Colo., on September 21 and 22. Ninety water works and equipment men and guests were registered, of which 46, including two new members, belonged to the Rocky Mountain Section.

President L. N. Thompson addressed the meeting on the activities of the A.W.W.A. and the part which water works will take in the postwar program. He placed special emphasis on the necessity of selling the importance of water works to the public by advertising and through good public relations. Pointing to training schools for plant operators, he recommended similar schools for personnel who meet the public from behind the counter.

B. V. Howe, Colorado State San. Engr., presented a paper on "Hard Water Tax." He pointed out that there is need for softening water in many municipalities in the Rocky Mountain region and explained the con-

*(Continued on page 48)**There's NO substitute for experience**That's why water works officials select the***NATIONAL METHOD****of water main cleaning**

Cleaning out clogged water mains works wonders in restoring maximum water supply. BUT the job must be done RIGHT if you want best results and savings in both time and money. There's one SURE way to get these results. Just turn the whole job over to NATIONAL. You get experience—facilities—expert workmen—100 per cent satisfaction. ## AUTOMATIC CONTROL of Treated Water Supply

R-S Butterfly Valves *simplify* the performance of the system because of the minimum pressure drop, unexcelled flow characteristics and reduced maintenance.

The opening or closing time of the valve vane can be varied from one second to an interval of several minutes. Such quick or slow action, coupled with the natural low head loss due to the valve design, means a *large saving in power on pumping operations* and wide adaptability in the handling of a multitude of materials.

### No. 501 Hydraulic Cylinder Control with Declutching Unit

20-inch, 125-pound, American Standard cast iron valve, ball bearing equipped. Declutching unit (patent applied for) permits operation of the valve with either the hand wheel or the hydraulic cylinder.

*(Continued from page 46)*

siderable savings that could be made in soap and other costs by the installation of softening methods. In a discussion which followed, however, Dana E. Kepner, San. Engr. and Mfr.'s Repr., emphasized the variations in the problem as each city faces it, and asserted that in some cities where only partial softening is needed it is more economical to have softeners on the hot water lines in individual homes.

A discussion of "Powers of Utility Commissions" was offered by R. L. Sherard, Water Supt., and C. A. Lathrop, City Attorney, Cheyenne, Wyo. The Cheyenne water department is operated under a six-man board of public utilities. The board has functioned extremely satisfactorily and has done away with political changes in operating personnel. The board now has full power to operate the water department, although at one time there was instituted a law suit to prevent the board from taking over such operations.

Major John J. Franks, Omaha, Neb., spoke on "Threshold Limits on Corrosive Waters." He demonstrated the characteristics of waters typical of the Rocky Mountain region and, by data, attempted to show that the Langlier threshold test does not always correctly indicate whether or not the water will be corrosive.

Emery L. O'Connell, Denver Attorney, described the necessary procedure for the formation of sanitary districts, and presented much information of interest to those involved in recently-formed or projected districts.

Paul Sandberg, Deputy Auditor of Denver, described in considerable detail the system of accounting used by his city.

Joseph A. McCarthy, Chief of Laboratory, Lawrence Experiment Station, offered a paper on chlorine dioxide which was read by Dana E. Kepner. McCarthy cited several experimental uses of chlorine dioxide for

Don't forget to order

## Repair Sleeves

We needn't remind you what leaking water lines can do to roadbeds, railroad crossings, bridges and other public construction . . . but we should remind you to place orders for Dresser repair clamps and split repair sleeves as early as possible.

The repair sleeves shown above represent only a small portion of the complete line of Dresser repair products. No matter what type of leak or break occurs in your lines, Dresser has or can make the proper type of repair clamp or sleeve.

Style 60—for repairing bell and spigot joints: 3" to 60" sizes.

Style 82—adjustable repair sleeve, for CIP distribution lines, from 4.70" to 9.07" OD.

Style 96—to permanently repair defective joints, splits or holes in steel pipe, 12" to 24" OD.

Style 57—for repairing breaks in straight run of cast-iron pipe, 2" to 12" sizes.

When the war is over—or earlier, if permitted—we will again be able to make prompt shipments from complete stocks. Until that time comes, let us know your requirements as far ahead of time as possible. Your orders will be entered on our production schedules immediately.

*Dresser Manufacturing Division, Dresser Industries, Inc., Bradford, Pa.; Houston Office and Warehouse, 1121 Rothwell Street, Sec. 16, Houston, Texas; in Canada: Dresser Mfg. Company, Ltd., 60 Front St., West, Toronto, Ontario.*

# **DRESSER** REPAIR CLAMPS and SLEEVES

(Continued from page 48)

the reduction of tastes and odors and stated that it can be successful in such application, although each water supply presents an individual set of conditions and laboratory experiments should precede plant tests. Some increase in taste and odor may occur when treatment is started, due to oxidation of pipe slimes, but this soon fades out. McCarthy pointed out that disinfection should be completed before chlorine dioxide is added, and too much reliance should not be placed on the higher chlorine residual carried in waters thus treated, as more studies are needed to determine the full extent of the effect of this treatment on bacteria. Operating costs for such treatment may be expected to amount to something between the cost of super-chlorination and of activated carbon. Higher chlorine residuals, which persist longer, may be carried in the finished water without taste or odor.

G. E. Arnold, Regional Engr., War Production Board, San Francisco, discussed the manpower and materials situation, and described the termination of the priorities system. He then continued with some comments on postwar work and outlined the various methods of financing available,

(Continued from page 50)

pointing to accumulated savings and to government aid. He added a footnote to President Thompson's speech on better public relations for the water works industry with the suggestion that someone design a streamlined fire hydrant of more attractive appearance than those now in use.

A discussion of DDT brought out the fact that, although this material is used in very low concentrations, any application on a large scale should be made by an individual familiar with its use, as there are certain hazards, such as burns or explosions, which may be encountered.

O. J. RIPPLE,  
*Secretary-Treasurer*

### MICHIGAN SECTION MEETING

The seventh annual meeting of the Michigan Section was held at the Pantlind Hotel, Grand Rapids, on September 19 and 20. The meeting, which was held jointly with the Michigan Conference on Water Purification, drew 152 persons.

BUY  
BONDS

That the MUELLER "B" Machine and the MUELLER Corporation Stops should receive world-wide acceptance by water works men is no accident. MUELLER invented the first machine for drilling and tapping mains under pressure. It is significant that, in the seventy-five years since, no one else has improved upon the MUELLER method or designed a better machine than the one shown here. MUELLER was the first to insert or remove corporation stops under pressure. As a result of numerous experiments, the threads on the stop were given a steeper taper to lessen the tendency to split the main. This MUELLER Thread, or "CC" thread as it is sometimes called, is now the accepted waterworks standard. Any MUELLER Stop will work perfectly in a MUELLER Machine because they have been developed together.

To these basic inventions MUELLER has added refinements in design, improved manufacturing procedures, better metals, precision machine work, and constant checking and testing to insure quality products. The result is better connections in less time, lower costs for installations, fewer service calls, and reduced upkeep expenses. Ample proof that these factors mean something to many water works men is borne out by the fact that 85% of all water works in America have installed dependable MUELLER Stops and 95% of them use the MUELLER "B" Drilling and Tapping Machine. As further proof of their popularity, remember that the MUELLER "B" Machine and Stops are used all over Central and South America, and in hundreds of other cities throughout Europe, Africa, and Asia. Let us serve you, too. Write us of your needs.

**MUELLER CO., DECATUR 70, ILL.  
LOS ANGELES 23, CALIF.**

Founded 1857

*(Continued from page 54)*

Plans for the meeting were made within the four weeks immediately preceding it. On August 8, the Section had been informed by the Committee on Conventions that the application for holding the meeting was not approved. However, the startling events of the next week resulted in a quick liberalization of convention restrictions and on August 22 the executive officers of the Section authorized the local arrangements committee and the program committee to proceed with plans. The meeting differed from preceding ones in that it was two days long, instead of three. Another departure was the inauguration of the club-room type of entertainment, replacing the older room type. The innovation was a success with members and manufacturers' representatives alike, and the Entertainment Committee and the Water and Sewage Manufacturers' Association decided to continue the same set-up at future meetings.

T. L. VanderVelde, Michigan Dept. of Health, opened the discussion with his paper on experiences with water treatment in various towns in the state. Discussions of experiences with their own water supplies were added by Henry Gork of East Grand Rapids, Lee Sensabaugh of Muske-

gon, Louis Harrison of Bay City, J. E. Cooper of the Ford Motor Co., H. E. Smith of Adrian, Henry La Fountain of Marquette and F. L. Glashaw of St. Ignace. The majority opinion appeared to be that super-chlorination (free chlorine residuals) has many advantages, especially in respect to the safety of the supply, taste and odor reduction, color removal and algae control. Free chlorine residuals could also be carried in the distribution systems without the use of ammonia. It was concluded that super-chlorination warrants a trial at all plants now using chlorine. Several persons entered the discussion with the report that phenol could be oxidized with chlorine without developing a taste, while experiences varied widely on the reduction of tastes and odors resulting from algae. Super-chlorination appeared not to be the complete answer in solving such problems and some supplemental treatment, such as with carbon, was indicated.

R. J. Faust, Chief of the Div. of Water Supply, Bureau of Eng., Michigan Dept. of Health, presented his annual review of newsworthy events in Michigan water works. Of particular interest was the beginning of fluoride treatment of the Grand Rapids water supply on Jan. 25, 1945. The cost of the treatment is averaging about  $6\frac{1}{2}$  cents per capita per year.

Norman Billings, Geology Div., Michigan Dept. of Conservation, and John Ferris, U.S. Geological Survey, delivered a paper on "Geology in Relation to Ground Water Supplies." They offered an outline of the water-producing structures of the state and described how some of them are formed. They explained how ground water yields may be determined and why local ground water resources are sometimes depleted. The services of their divisions were offered to water works officials of the state who need help in solving ground water supply problems.

Dr. W. C. Bauman, Dow Chemical Co., Midland, presented a paper on "Synthetic Resins" (see page 1211, this JOURNAL).

Andrew Dempster, San. Engr., Detroit Dept. of Health, gave a unique presentation on "Back-Siphonage and Cross-Connections," by relating the history of the development of a fictitious war-constructed town. Colbank, located on the banks of the Coliform River, encountered all of the plumbing and cross-connection difficulties known so well to us today. How Mayor E. Typhosa solved these difficulties was fully described.

Louis Ayres, Cons. Engr., Ann Arbor, defined the advantages and faults of new and old pumping equipment in "Some Problems Connected With Electrical Pumping" (see page 1166, this JOURNAL).

John Dye continued his discussion of pH and alkalinity in relation to the control of a lime-soda softening plant. He exhibited a set of nomographs showing the relation between pH and alkalinity in water under a wide range of temperature and total solids and made some suggestions concerning possible applications of the nomographs.

Dr. F. S. Leeder, Director, Bureau of Epidemiology, Michigan Dept. of Health, in his paper "Water May Be Dangerous," complimented the water works profession in Michigan for its splendid record of no water-borne typhoid fever in the state during the past eleven consecutive years and indicated the possibility that some virus diseases may be water-borne.

Harry Ward, Chemist, Wyandotte Filtration Plant, discussed "The Application of Chlorine Dioxide to Municipal Water Supplies," and reported that he was favorably impressed with the results obtained in the reduction of tastes and odors during the short period of time it has been applied to the Wyandotte supply.

The meeting closed with reviews of papers given at the Inservice Training Course at Ann Arbor last April. Harry McEntee, Ann Arbor, discussed papers on iron bacteria, chemistry of iron in water and iron removal, while W. L. Harris, Grand Rapids, discussed papers on fluorides and dental decay.

An inspection trip was arranged for the conferees to observe the methods used in the handling, application and control of fluorides at the Grand Rapids filtration plant.

Raymond J. Faust was nominated for the 1945 Fuller Award.

## PERMUTIT SPAULDING PRECIPITATOR INCREASES CITY'S CAPACITY FOR TREATING WATER SUPPLY ... AND IN LESS LAND SPACE!

**PERMUTIT SPAULDING PRECIPITATOR** removes water hardness, dirt and color by the sludge blanket process. This new-design equipment cuts detention time, saves chemicals, takes only half space of former methods.

Expansion of municipal water softening capacity need not mean relocation of water works, or even extra space. The Permutit\* Spaulding Precipitator, which increases the rate of flow, actually requires *less* space than former methods and provides, in addition, greater economy of operation than was previously possible.

In your blueprints for water improvement, recommend modernization of *present* municipal systems with space-saving, time-saving Permutit Water Conditioning Equipment. There is no more efficient way to meet the needs of citizens and industry for soft water in tomorrow's community. For complete details, address The Permutit Company, Dept. G2, 330 West 42nd Street, New York 18, N. Y. or Permutit Co. of Canada, Ltd., Montreal.

WATER CONDITIONING HEADQUARTERS

(Continued from page 60)

**The 1945 South Dakota Water and Sewage Works Conference** will be held at Mitchell, S.D., on December 6 and 7, with headquarters at the Lawler Hotel, according to a recent announcement by Quinton B. Graves, Acting Director, South Dakota State Board of Health, Pierre, S.D.

**The Southern States Chemical Co.** has purchased a large tract of land on Marietta Rd., Atlanta, Ga., where it expects to construct a new warehouse and office within the next year. The Southern States Chemical Co. was formed on Oct. 1, 1944, to take over the business released by the Industrial Chemical Div. of the Hercules Powder Co. when that organization retired from the less-than-carload field. The new company now handles carloads of several items which Hercules Powder Co., has discontinued in the Southeast, including aluminum sulfate, liquid chlorine, copper sulfate, ferric sulfate, ammonia and activated carbon.

H. M. Thompson, who was Resident Mgr. of the Atlanta office of Hercules for seventeen years, is president of the new company, and eleven of the twelve staff members are former "Herculites."

## NEWS OF THE FIELD

During 1945, the A.W.W.A. has undertaken new responsibilities of a nature which will undoubtedly affect its future materially and serve to benefit all water works men. The first rather simple step is the affiliation of the A.W.W.A. with the U.S. Chamber of Commerce. Affiliation with another association is not so important as the attitude involved in the act. By this step the A.W.W.A. has recorded itself to be a part of the business life of the American community. It hopes that every water department and company will take part in the local Chamber of Commerce activities. More than that it believes that local Chambers of Commerce will come to understand better the vital relationship between adequate water supply and community growth.

Industry and water supply depend upon each other for their growth and no American city or its Chamber of Commerce can get very far ahead if the city's water supply is deficient. Thus when the A.W.W.A. became a member of the U.S.C. of C., it made plain its belief that water supply is a part of business and industry—gaining as a result of joint action—failing because of inefficiency or lack of understanding. We propose to move forward.

The second step taken during 1945 was the acceptance of the challenge that we make public relations a part of our organized activities. One of the peculiar byproducts of the growth of municipal ownership has been the idea that a municipal plant had no public relations problem or that it had no reason to try to improve its relations with its customers. The A.W.W.A. has for many years opposed such opinions, but has not previously felt that organization of a public relations program was a task for the Association. Now a "Survey" Committee is at work—and will bring a set of recommendations to the Board of Directors at the January 1946 meeting. What definite projects for 1946 will be approved by the Board no one can prophesy—but that a postwar public relations improvement program is on its way, there is no doubt. Let us all hope that we understand that in this, as in many other matters, the A.W.W.A. can only show the way, cut the pattern as it were, and that only at the level of the individual water department or company can a public relations program actually go to work and achieve results. The A.W.W.A. can plan or organize. The Water Works Man must and will "make friends and influence people."

*(Continued on page 2)*

(Continued from page 1)

For the seventh time in its seven-year history as an Association award, the Old Oaken Bucket was won by the California Section for having the highest section membership in the A.W.W.A. The award was made at the section meeting held in October, and is here displayed by William W. Hurlbut, Cons. Engr., Los Angeles, and Past-Pres. and Honorary Member of the Association.

The Old Oaken Bucket is customarily carried to the Annual Convention by the California Section and thereupon reawarded to the Section. Then it is carried back to California for another year. California Section membership on June 30 was 655. Its nearest competitor is the New York Section, with 529 members on the same date.

(Continued on page 4)

## Desperate Need for Scarce Journals

There has been tremendous and gratifying membership response to the Association's appeal for rare numbers of the JOURNAL for war-torn libraries and for libraries cut off from communication with the "outside world" during the Occupation. The Association has now shipped overseas a number of volumes completed by the acquisition of these rare copies. This leaves the shelves empty of the issues listed below, which are needed to complete more sets, still required overseas.

Won't you please go over your shelves and see if you can part with any of these issues of the JOURNAL. If you feel that you can, send them, but ONLY them, immediately to the American Water Works Association, Inc., 500 Fifth Ave., New

York 18, N.Y. Receipt will be acknowledged by a check in payment, to the amount of \$.50 per copy.

**DO NOT SEND COMPLETE VOLUMES TO ASSOCIATION HEADQUARTERS.** The headquarters office has an unbalanced stock and needs certain numbers with which to complete volumes. It has no use for JOURNALS NOT listed above. If you have complete volumes of the JOURNAL which you wish to dispose of, record the fact with headquarters by letter. It may then be possible for headquarters to ask you to ship such volumes directly to a purchaser.

*Soft* WATER CAN HELP  
SOLVE A *hard* PROBLEM

MANY CITIES MUST FACE IN  
POSTWAR...

HOW to attract industry... how to make citizens happy and contented—this is the problem confronting municipal management now.

One thing sure to click, with industrialist and resident alike, is good city water—free of hardness, dirt and iron.

Permutit\* Water Conditioning equipment removes the impurities found in all natural water supplies.

It makes a city completely independent of local water conditions.

Your city's future can be brighter than ever with soft, clear water sparkling from every faucet in town. Get the facts about Permutit's economical equipment.

Write to The Permutit Company, Dept. G2, 330 West 42nd St., New York 18, N. Y., or Permutit Company of Canada, Ltd., Montreal.

**O. J. Ripple**, Secy.-Treas. of the Rocky Mountain Sec., A.W. W.A., and **B. V. Howe**, Director from the Section, have formed the consulting engineering firm of Ripple & Howe, Denver, Colo. Ripple has also been a Director of the Association, and both men are holders of the Fuller Award from their Section. Ripple & Howe succeeds to the practice of the late Burton Lowther of Denver and is devoted to all phases of water and sewerage work.

Ripple has been Supt. of Filtration for the Denver Munic. Water Works for almost 22 years, during which time filtration plants with a designed capacity of 100 mgd. were constructed. Before that he was hydrographer and draftsman for the Farmers Reservoir and Irrigation Co. He was graduated from Colorado Agricultural College with a Civil Eng. degree in 1909.

After being graduated from the Massachusetts Inst. of Technology, Howe was engaged for a year with the Massachusetts Dept. of Health, two years with Weston & Sampson, Cons. Engrs., Boston, and two years on the Boston water supply. For the past fifteen years, he has been Chief Engr. of the Colorado State Dept. of Health.

## *This Pipe Wears A Girdle* **FOR A 500 PSI. PRESSURE JOB!**

"We want a special 30-inch lateral fitting that will take extreme water hammer and pressures up to 500 psi.!"

This was part of the specification for ARMCO Steel Pipe in a high pressure main for a large municipal water supply line. The fitting was no routine job; so Armco engineers "knuckled down." They designed a lateral with special welded reinforcements. It was mill-tested at a pressure of 500 psi.—with ends unrestrained. It didn't leak a drop or show any sign of distress.

Special prefabricated fittings like this make it easy to design water lines to fit your requirements.

ARMCO Spiral Welded Steel Pipe has other advantages, too. Installation and maintenance costs are low, and there are fewer joints to service. ARMCO Pipe maintains high flow capacity indefinitely.

Diameters range from 6 to 36 inches, with wall thicknesses from 7/64 to 1/2 inch. For more information on ARMCO Steel Pipe just address Armco Drainage & Metal Products, Inc., 2961 Curtis Street, Middletown, Ohio.

**The Hagan Corp. and its subsidiaries**, Hall Laboratories and Calgon, Inc., of Pittsburgh, have instituted a plan to encourage their employees to attend night school in order to gain the educations necessary for upgrading. Frankly an investment, the idea originated because of the present scarcity of young chemistry and engineering students, but is expected to be continued after the flow of new men and women is resumed. The plan will be continued, however, only so long as it is felt that the results justify the expense. The way the plan will function is this:

1. Any member of the associated companies who is eligible to register for under-graduate or graduate courses in a field related to the technical or business activities of the companies may participate.
2. On presenting to the company the receipt for tuition and fees, the participant will receive one-half of the sum paid out.
3. If the participant successfully completes the required curriculum and receives a degree while still in the employ of the companies, he will then be paid the remaining half of all receipts for tuition and fees presented to the company during the period from date to the granting of the degree.

### **HIGH QUALITY VALVES HYDRANTS**

M & H products, including pipe line accessories, are well known for high quality of material and expert workmanship. They are made according to standard specifications and have been used for many years throughout the country. Write for Catalog No. 34. Address M & H Valve and Fittings Company, Anniston, Alabama.

Among products that have been proved by many years of experience, cast iron pipe is in the highest rank. Consider its truly remarkable record.

Cast iron water mains were pioneered in America 120 years ago. Today, in 200 out of 212 of our largest cities, some or all of the original cast iron mains are still in service, in many instances after more than a century. In the 15 largest cities, more than 95% of the pipe in the water distribution systems is cast iron pipe. In the three largest cities—New York, Chicago, Philadelphia—the ratios are, respectively, 97%, 99% and 98%. Thus it is evident that topflight engineers *continue* to endorse the judgment of four generations of water works men.

Confidence, based on experience, is doubly important in the case of pipe to be installed underground for distribution mains. They represent the major investment in a water supply system. So we say—*trust the pipe you know about.*

Cast Iron Pipe Research Association,  
Thomas F. Wolfe, Research Engineer,  
Peoples Gas Building, Chicago 3, Ill.

SERVES FOR CENTURIES

*For Savings Ask*

*(Continued from page 20)*

Participation in the scholarship plan will not relieve an employee from regular or emergency duties which may on occasion require him to absent himself from classes, although an effort will be made to interfere as little as possible with the educational program of each participant.

The companies recognize that obtaining an education after working hours is not an easy task to undertake. To obtain a college degree in night school requires at least eight to nine years. However, the companies are encouraged in the program by the number of men and women in their employ who have completed their educations in this way, and thus fitted themselves for better posts in the companies. The secretary of the director of the plan, a woman who already held a bachelor's degree, worked after hours for her master's degree in personnel work. Various technical staff men have obtained degrees in chemistry, chemical engineering and mechanical engineering. One chemist took up law so that he could be of use with respect to Hagan Corp.'s patent activities. And right now the librarian is studying Russian so that he can abstract technical papers from the Russian literature.

## Famous Facts

"The Wedding of the Rails"—the driving of the golden and silver spikes to symbolize the joining of the Central Pacific and the Union Pacific lines—at Promontory Point, Utah, May 10, 1869, marked the completion of the first transcontinental railroad. Four years before, the Union Pacific had begun to lay its 1,085.8 miles of track westward from Omaha, Nebraska. At the same time, the Central Pacific was coming eastward with its 690 miles.

By the time the first transcontinental railroad was built, Bitumastic Enamel—the first product of its kind—was already winning widespread recognition as a protective coating for underground and underwater metal surfaces. In the water works field the high Williams & Hazen coefficient of Bitumastic 70-B Enamel and its ability to prevent tuberculation and corrosion, have made it the choice of engineers in important projects from coast to coast.

# GENERAL CHEMICAL "ALUM"

## ... EQUALLY EFFICIENT FOR COAGULATION OF WATER and SEWAGE!

Today, aluminum sulfate is almost universally accepted by water experts as the best coagulant for the removal of turbidity, color and bacteria from water . . . and General Chemical Aluminum Sulfate is the outstanding choice the nation over. The reason? Operating men have come to rely on its high quality and constant uniformity, knowing that the effectiveness of General Chemical Alum has been "proved in the settling basins" year after year in

towns and cities all over America.

Municipal officials in charge of sewage disposal find that clarity and purity of sewage effluent are also easily obtainable with General Chemical Aluminum Sulfate because of the many reasons noted below. Why not join the majority of American cities that prefer General Chemical Alum—and specify "General" for *your* water works and sewage disposal systems? Ask any Technical Service Office for details.

### ★ FOR WATER WORKS

1. Produces crystal-clear water.
2. Gives better floc formation resulting in longer filter runs.
3. It is a low-cost coagulant.
4. Has no chlorine demand, conserving chlorine exclusively for disinfection.
5. Superior in tests against other coagulants.
6. High in quality, its constant uniformity can be counted upon.
7. Aids in the reduction of tastes and odors.

### ★ FOR SEWAGE PLANTS

1. Clean, easy to handle, dry feeds well, and economical to use.
2. Simple application, requires only low cost feeding apparatus and minimum attention.
3. Clear, colorless effluents are possible.
4. Sludge digests readily.
5. Treated digested sludge dries quickly, with a minimum of odor.
6. Chlorine consumption is cut due to lower demand of clarified sewage.

LOOK TO A THOROUGHbred  
*for*  
PERFECT CONTROL

Direct Acting  
Controller  
for Water Works

*Reduced from actual chart.*

**PERFECT RATE CONTROL BECAUSE . .**

Annular pressure — averaging chamber measures the flow more accurately. Superior design avoids air pockets—no hunting. Balanced control valve responds to slightest change in flow. Every bearing is of the anti-friction type—no balancing links or pivots.

**TROUBLE-FREE BECAUSE . . .**

Molded, flexible rubber piston seal won't rub, catch or reverse. Heavy piston rod of hardened stainless steel will not bend or corrode. Single sturdy control valve blade is arched; can't buckle. Controller requires no power supply; self-actuated. Bronze-lined Venturi throat — Everdur bronze bolts and screws at no extra cost.

# Keep Calling for CALKING LEAD ...IT PAYS!

**J**OINTS calked with lead have sufficient flexibility to absorb ground movement without damage to either pipe or joint. Also, lead calked joints may be quickly and easily repaired without interrupting the flow.

Important too, are the facts that lead joints are unaffected by thio-bacilli, are electrically conductive, and no close temperature control is required to make them. They have generations of proved performance behind them.

## LEAD

### INDUSTRIES ASSOCIATION

420 Lexington Avenue • New York 17, N. Y.

*You're money ahead when you work with lead*

#### Why lead pipe is "Tops" underground

1. *Its flexibility prevents damage from ground movement or settling.*
2. *Eliminates costly joints.*
3. *Resists corrosion.*
4. *Does not clog.*

Insist on calking lead and lead pipe which meet recognized national standards such as A.W.W.A. 7D. 1 — 1938, Federal Specification WW-P-325, Lead Industries Association Standards, or CS94-41 and CS95-41 of the National Bureau of Standards. Such lead products may be identified by this Seal stamped on them for your protection. Write for copies of these standards and specifications and for our free magazine, "Lead."

# STOP FISH

## BY ELECTRONICS

This patented fish control method employs modern electronics in overcoming a serious operating and maintenance problem. Fish of all sizes are kept at a *safe distance* from intake structures, or screens, by the use of an Electronic Control Unit. This equipment, generating special electrical impulses, energizes an electrode system designed and engineered for your particular fish control problem.

The Burkey Electric Fish Screen has been thoroughly proven through years of service in Condensing Water Intakes, Hydroelectric Plants, Water Systems and Industrial Pumping Installations.

**DOES NOT STUN OR KILL FISH.**

*Recommended by State Conservation Officials.  
Free literature and quotations upon request.*

## For Better Treatment of Turbid Water in Less Space

In a single, compact structure, the Dorrco Clariflocculator combines two essential steps in turbid water treatment—mechanical flocculation and continuous sedimentation. The volume and area provided in a Dorrco Clariflocculator are the same as for an individual clarifier in the same service—exclusive of the volume and area of the Flocculator which would also be required if separate tanks were used.

Heavy, dense flocs are formed in the central flocculation compartment of this Dorr combination unit, and pass gently into the outer sedimentation compartment *without disintegrating*. The Dorrco Clariflocculator is therefore particularly efficient where fragile flocs are formed or maximum removal desired. Taste-producing sludge is mechanically removed so rapidly that it does not have a chance to impair the quality of the treated water.

Have a Dorr engineer tell you what users report about the low *first cost* and low *operating cost* of the compact, efficient Dorrco Clariflocculator. For drawings, operating data, results of comparative tests, write for Clariflocculator Bulletin.

"We can't get along

without

**CALGON** \* "

We believe that we did a pretty good job of keeping our customers supplied with Calgon during the war, in spite of the fact that government requirements came first.

Nevertheless a shipment to one water system went astray, apparently side-tracked for war freight—and we heard from the customer in a hurry.

"It is imperative," their purchasing agent wrote us, "that we have a supply of Calgon on hand at all times. We were out for three weeks on one occasion, and as a result received numerous complaints which would otherwise have been unnecessary."

In hundreds of communities, Calgon is used in water supply systems to prevent scale, inhibit corrosion, and prevent the precipitation of dissolved iron—all at extremely low cost.

Make threshold treatment with Calgon a part of *your* public relations program. Let us send you full information.

\* Calgon is the registered trade-mark of Calgon, Inc., for its glassy sodium phosphate products.

# The economics of cathodic protection

## demand a **stable** pipeline coating

**W**hen considering the installation of Cathodic Protection for pipelines, it is important to select a pipe protection whose underground electrical insulating properties are not affected by varying moisture content of the soil during changes in season, weather or by time itself. Obviously, the correct amount of electrical current cannot be varied continually to compensate for the fluctuations in current required.

Barrett *Coal-tar* Enamels possess this all-important *stability* of high dielectric strength. Because of their resistance to moisture absorption, they provide a constant, uniform and long-lasting stable insulation.

Coal-tar Enamels, applied by the modern mechanical methods now in use, and electrically inspected, assure the proper continuity of a stable insulation—and require less current and smaller capacity equipment to make Cathodic Protection economical.

The effectiveness of Barrett *Coal-tar* Enamels in preventing corrosion in conjunction with Cathodic Protection has been established through years of service in all types of soil and climatic conditions. A dependable guide to engineers when designing corrosion-proof pipelines.

**FIELD SERVICE:** The Barrett Pipeline Service Department and staff of Field Service men are equipped to provide both technical and on-the-job assistance in the use of Barrett Enamel.

**Philip B. Streander** has organized the firm of Philip B. Streander & Affiliates, which will engage in water supply, treatment and distribution consultation. Affiliates in the company are Damon & Foster, Sharon Hill (Philadelphia), Pa., which will handle engineering work in the middle Atlantic states, and Cleverdon, Varney & Pike, Boston, which will secure and direct projects in the New England states. An office has also been opened in Washington, D.C. At the present time, the company is engaged on contracts with Hingham, Mass., and Delaware County, Pa.

For the past five years, Streander has been engaged by Stone & Webster Eng. Corp. of Boston on water supplies and general sanitation work on their large defense and war projects, among which was the one at Oak Ridge, Tenn. From 1933 to 1940, Streander was a partner in the consulting practice of Watson & Streander, New York City.

**William A. Meissner Jr.**, who for the past two years has been officer in charge of the Copper Sec., Bureau of Ships, Washington, D.C., has been appointed director of sales for Silverstein & Pinsof, Inc., brass, bronze and aluminum firm of Chicago. Meissner relieves Milton Silverstein, president of the company, who was in charge of sales until October 15.

Prior to the war, Meissner was sales manager for Farnan Brass Works, Cleveland. He went to Washington early in 1942 as chief of the Foundry Production Sec., Copper Div., War Production Board, and was later commissioned Lieutenant in the Naval Reserve.

**Peter C. Reilly**, Pres. of Reilly Tar & Chemical Corp. and of Republic Creosoting Co. of Indianapolis, Ind., has recently created the P. C. Reilly Science Fund at Notre Dame Univ. The endowment is \$1,000,000, the largest single gift in the history of the university.

The fund will be specifically devoted to chemistry and chemical engineering, and a part of the income has been earmarked for a fellowship to the outstanding lay members of the graduating class in chemistry or chemical engineering departments of Notre Dame; four annual graduate non-teaching fellowships of \$1,000 for graduates of any chemistry or chemical engineering schools; and an honorarium of \$5,000 annually to an outstanding chemist or chemical engineer for a one-semester series of lectures at Notre Dame.

At the end of eight years, the number of annual graduate non-teaching fellowships will be increased. After 50 years, the income from the accumulated capital fund shall be divided equally, half to be used for fellowships and lectures and half to be added to the capital fund.

Reilly has been a member of the Notre Dame Board of Lay Trustees since 1934. He entered the American coal tar industry in 1886 when he joined one of the original coal tar distillers in the U.S. and was sent from New York to Indianapolis by his employer to manage the Western Chemical Co. In 1900 he organized his own business in Indianapolis under that name, and subsequently reorganized it as the Republic Creosoting Co. In 1932 he purchased the International Combustion Tar & Chemical Co., which operated plants in several states, and which is now a part of the Reilly Tar & Chemical Corp.

The Reilly Corp. maintains research laboratories in Indianapolis, where a large research organization is engaged in the development of new coal tar products. Among the developments of the Reilly laboratories is a process for the complete distillation of coal tar, which has made available many new and valuable materials with wide applications in industry.

*(Continued from page 44)*

The Illinois State Water Survey at the Univ. of Illinois is this year celebrating a half-century of service to the water supply field, and its Chief, A. M. Buswell, is completing 25 years in his post. The water survey was inaugurated in 1895, when the university's Chemistry Dept. undertook the responsibility of analyzing water supplies in the state in an effort to stem the typhoid epidemics which swept Illinois every ten years. Although the earliest work was in analysis and the establishment of sanitary standards for drinking water, by 1911 the state legislature appropriated funds directly for a State Water Survey, making possible the extension of the laboratory's activities to cover problems in water softening and treatment and stream pollution. At the same time, an inventory of Illinois's water resources was begun.

In 1915, sewage treatment research was begun under Prof. Edward Bartow, then Director. Dr. Bartow, a pioneer in the recognition of the modern activated sludge process, is an Honorary Member of the A.W.W.A.

In 1917, the state legislature transferred the water survey from the university to the Dept. of Registration and Education, but the survey continued to function in close co-operation with the university and to be located in the university's Chemistry Building.

## Many Field Bends and "Specials" Eliminated with Dressers

Because Dresser Couplings permit approximately 4 degrees of deflection from pipe section to pipe section (from  $10^\circ$  for small diameter pipe to  $\frac{1}{2}^\circ$  for very large diameter pipe), it is possible to build moderate curves in a pipeline without resorting to pipe bending in the field.

Obstacles such as rock strata, buildings, poles and ground elevations need not delay pipeline construction. Special surveys, to avoid trouble at these points, are unnecessary.

None of the other Dresser advantages are sacrificed in building a curve in this manner. Dresser Couplings can be installed with the same speed, and assurance of no leakage, that is possible with straight-line building. No skilled workmen are required for any Dresser Coupling installation.

From 65 years of experience with all types of pipelines, Dresser has accumulated one of the most complete sets of pipeline data in the world . . . to help you build pipelines. Send us your inquiry on any pipe joining problem.

**DRESSER MANUFACTURING DIVISION**

### DRESSER COUPLINGS

for maximum  
joint  
flexibility

Style 38

Cross Section

Dresser Couplings are simply installed . . . and easily salvaged for new lines. Two resilient gaskets held in compression, grip pipe tightly . . . but also permit considerable latitude in pipe deflection to permit building curved pipelines. This flexibility also permits expansion and contraction of pipe sections without setting up harmful stresses . . . the key to the decades of service with practically no maintenance so characteristic of Dresser-coupled pipelines.

*(Continued from page 46)*

The survey's studies of water resources begun in 1911 were amply validated when the published collection of information was a strong staff to lean on during the drought of 1936 and during the wartime industrial water problems.

During the war, the chemical staff of the survey has co-operated with the university and the Army in developing weapons for detecting and counteracting poisons in water.

The survey plans postwar research to aid in municipal and industrial expansion, flood control, recreation area development and similar projects. The staff totals 30, including several individuals now on military leave, and the biennial budget is \$250,000. The survey will soon have its own building on the university campus, but will continue to maintain the close contact with the chemistry, engineering and other departments of the university which it has enjoyed for 50 years.

**"Correlation of Ground Water Levels and Precipitation on Long Island, New York,"** is the title of a paper recently prepared by C. E. Jacob and the Jamaica, N.Y., office of the U.S. Geological Survey and reprinted from the Transactions of 1943 and 1944 of the American Geophysical Union as New York Water and Control Commission Bulletin GW-14. The paper is designed to "justify the use of the cumulative departure from progressive averages for correlating precipitation with ground water levels and with 'ground water flow' in streams, thus combining in a sense the idea of cumulating departures with the idea of using progressive averages." The 24-page pamphlet is profusely illustrated with charts, maps and tables.

**The Engineering Experiment Station** at Louisiana State Univ., Baton Rouge 3, La., has an opening for a research associate in chemistry or chemical engineering with experience or training in water treatment and an interest in analytical technics. The position will be permanent, with work toward an advanced degree in chemical engineering possible. Anyone interested should address M. C. Schwartz, Asst. Director of the Eng. Expt. Sta., giving details of his education, experience, salary expected, draft status, references and recent photograph.

**Cecil H. McLain**, former Sr. Research Chemist with J. S. Abercrombie Oil Co., Old Ocean, Tex., has opened his own office as consulting engineer in Houston. He will handle water problems and problems of waste disposal, corrosion of process equipment and pipeline systems. McLain, who holds a B.S. degree in Chem. Eng. from Rice Inst. and an LL.B. from the Houston Law School, was for ten years with the Sinclair Refining Co. as a chemical engineer.

**MISSOURI VALLEY SECTION MEETING**

The Thirtieth Annual Meeting of the Missouri Valley Section, its first postwar meeting, was held at the Hotel President, Kansas City, Mo., on October 29 and 30. Registration totaled 166 members and guests.

Following a pattern which was initiated several years ago the program consisted of a series of panel discussions. Topics for these discussions were chosen from the results of a survey which had been made before the 1944 meeting, which was canceled.

"Distribution System Problems" was the topic given to a panel consisting of Mark A. Driftmeir, Supt., Burlington, Iowa, Water Works; H. H. Kansteiner, Mgr. of Production and Distr., Leavenworth, Kan., Water Works Dept.; and C. E. Schanze, Mgr., Joplin, Mo., Water Works Co. Practices in making water main extensions, amount of deposit guarantees required, minimum size of pipe and residual pressures in distribution systems were discussed.

The chief public health engineers of the five states in the Missouri Valley Section area made up the panel which was assigned the topic "State

Board of Health Interest in Water Works." The participants were W. Scott Johnson, Chief Public Health Engr., Missouri Div. of Public Eng. & Ind. Hygiene; A. H. Wieters, Chief Engr., Iowa State Health Dept.; T. A. Filipi, Director, Div. of Sanitation, Nebraska State Board of Health; Paul D. Haney, Chief Engr., Kansas State Board of Health; and Quinton B. Graves, Chief Engr., South Dakota State Board of Health. Official approval of public water supplies, training water plant operators, the new U.S.P.H.S. standards for drinking waters, and the elimination of sanitary defects in water works systems were discussed by members of the panel.

"Procedures Affecting Public Relations in the Water Works Industry" were discussed by a panel consisting of J. J. Hail, Supt. of Water Works, Dubuque, Iowa; Andrew J. Reiff, Supt. of Water and Light Depts., Hastings, Neb.; Robert S. Millar, Mgr., Wichita, Kan., Water Works; and I. H. Reed, Vice-Pres. and Mgr., Sedalia, Mo., Water Co. The discussion was particularly concerned with the methods used to collect delinquent accounts and the procedure followed after the account proved uncollectible. It was the consensus that every possible means should be used to avoid the necessity of shutting off the water service.

The final panel was given the topic "New Horizons in the Water Works Industry." H. V. Pedersen, Supt. and Gen. Mgr. of Water Works at Marshalltown, Iowa, pointed out that among "Personnel and Management Problems" presently confronting the industry were those of retirement of personnel and conservation of sources of water supply. John A. Strang, Div. Mgr. of the Wallace & Tiernan Sales Corp., Kansas City, in a paper entitled "Trends in Sterilization," discussed chlorination. Herbert O. Hartung of the St. Louis County Water Dept. at University City, Mo., reviewed "Trends in Water Purification." Data collected at Army installations on corrosion and incrustation have added valuable knowledge concerning these difficult problems. The sodium arsenite method of differentiating between true and false chlorine residuals as determined by the ortho-tolidine test is proving helpful. As yet silica has not been widely used in the coagulation of water but it offers interesting possibilities.

At the annual dinner of the Section it was announced that the Missouri Valley Section had conferred the George W. Fuller Award on Otto S. Reynolds of Kansas City in recognition of his outstanding work as Chairman of the Membership Committee during the past two years.

EARLE L. WATERMAN

# FLOAT SWITCH CONTROL

As indicated by the diagram, the float switch controls the power-operated, slow-acting R-S Valve which maintains a constant water supply in the storage tank.

Similar applications of automatically operated R-S Valves can be equipped with an air diaphragm, oil or hydraulic cylinder for control and shut-off. The result is simplified performance, prevention of water hammer and line damage, unexcelled flow characteristics and reduced maintenance.

R-S Valves are used advantageously to reduce, regulate and shut off pressure; to control liquid level; to relieve and control back pressure; to maintain a constant differential pressure; to control rate of flow and govern the output of pumps.

**No. 617.** Extremely slow-acting valve equipped with electric motor control. The hand wheel on a gear reduction drive is for manual operation in case of power failure. Note the extended lever for operation of sister valve in parallel line. Write for detailed information and Catalog No. 14-B.

### **SOUTHWEST SECTION MEETING**

The Southwest Section held its Thirty-Fourth Annual Meeting in Shreveport, La., October 16-17, with Thomas L. Aniss, Supt.-Engr. of the Shreveport plant, serving as host.

The registration of 212 was low due to the uncertain conditions that prevailed when the meeting was planned. Two full days were devoted to program papers, and the theme running through the entire meeting emphasized public relations and membership promotional work. The sessions were well attended and the program consisted briefly of the following:

Chairman A. H. Ullrich, Chemical Engr., Water Dept., Fort Smith, Ark., read his Annual Report, in which he emphasized the creation of a public relations program on the national level, designed to upgrade the industry. (Later the Resolutions Committee endorsed such a program.) Ullrich also called for more support in membership promotional work to obtain a higher saturation in the Southwest Section. (The Board of Trustees at a post-convention meeting authorized a principal officer of the Section to attend each state meeting to encourage affiliation with the American Water Works Association.)

Aniss briefly reviewed his experiences as a Director of the A.W.W.A. from 1942 to 1945, and the scope of the activities of the national office during the period. Attention was drawn to the efforts of the A.W.W.A., in co-operation with the War Production Board, to gear the water works industry to wartime operations.

Albert R. Davis, present Director from the Southwest Section, and Supt. of the Austin, Tex., Water Dept., outlined some of the activities now under way, emphasizing the work of the Survey Committee in connection with a "Public Relations of the Water Works Industry" program and the "Blueprint Now" program resulting in over 1.5 billion dollars of con-

### NATURE'S PERFECT DRINKING WATER...RIGHT IN YOUR HOME

Almost a year ago Mathieson advertisements told you of the development of the Chlorine Dioxide technique for treating public water supplies to overcome taste and odor problems.

Now—to bring you up to date and inform you how soon communities with such problems may hope to enjoy the really fine drinking water this process produces.

Mathieson has stepped up production of Sodium Chlorite (from which Chlorine Dioxide is generated) to much higher levels than was thought possible even a year ago. Availability of the chemical, however, is not the sole factor. Each water supply must be thoroughly analyzed before recommendations can be made—for no two sets of conditions are alike.

It is of greatest importance to Mathieson that each community which will use the Chlorine Dioxide technique be as enthusiastic as are those where the technique is already producing such highly satisfactory results... and our field staff has been augmented by men with water works experience who are being specially trained in Chlorine Dioxide technique. *Chlorine Dioxide is worth waiting for!*

THE MATHIESON ALKALI WORKS (INC.)

struction in the planning stage. Davis also stressed the importance of gaining additional members and greater interest in research activities.

Clyde E. Fant, Comr. of Public Utilities, Shreveport, pointed out the value of applying sound business principles in the operation of a water utility. He revealed how a non-partisan honorary board of seven business men had guided the Shreveport plant through a period of most efficient and successful operation.

A joint paper by W. S. Mahlie, Chemist, and Uel Stephens, Supt. of the Fort Worth, Tex., water system, described how the construction of concrete reservoirs, in lieu of "hard-to-get" additional pumps, solved a distribution problem resulting from increased wartime consumption demands and at the same time provided improvements that will fit nicely into a proposed master plan of distribution.

A. M. Smith, Supt. of Meters and Distribution, Shreveport, recited the splendid results of a concentrated drive to eliminate all cross-connections on the Shreveport system. He reported that in a two-year "crusade" approximately 13,000 inspections were made and 300 violations were found and corrected, thus removing the penalty of a provisional certification of the Shreveport water supply system.

Prof. Edward R. Stapley, Acting Dean, Div. of Eng., Oklahoma A. & M. College, Stillwater, Okla., started off a discussion group with some "Thought Bombs." He made no attempt to furnish the answers, but all of his subjects were thought-provoking. He commented briefly on the following questions: "Human Engineering—Why Not a Little More Attention to the Personnel?" "Depth of Sand in Rapid Sand Filters—Why 30 in.?" "Application of Job Design as Related to Efficiency." "Functions of Management—Why Not More Creative Work?" "Salaries of City Officials and Employees—Why Less Than Private Enterprise?" "Operation of Lakes and Reservoirs—Why Not Have More Recreational Facilities?"

A. P. Jones, Consolidated Chemical Industries, Inc., Houston, Tex., pointed to the rapid expansion of industry throughout the Southwest area, and emphasized that a prime requisite of establishing a new location for industry is the availability of a satisfactory water supply. He reported that the water works men of the Southwest should take steps to furnish industrial requirements to increase their sales.

# ACCURATE FLOW MEASUREMENT at *LOW COST* THE **SIMPLEX MS METER**

**T**his low cost Simplex instrument meets the high standards for accuracy, sensitivity and dependability required in measuring flow rates in water and sewage, as well as in power and process plants.

These are some of the advantages of the Simplex MS Meter:

1. Operates efficiently with any suitable primary device.
2. Is installed and maintained economically.

3. Rugged, trouble-free construction.
4. Accuracy over entire flow range.
5. Simplex bell-shaped float which translates the half power of the differential into uniform graduations of chart and dial.
6. Direct reading totalizer of the 7 digit type.

Complete data is now available in Bulletin 350 — straight-forward, factual information with drawings, charts, and test data. Write for your copy today — specify the Simplex MS Meter in tomorrow's planning.

*(Continued from page 56)*

Leonard N. Thompson, Pres. of the A.W.W.A., explained the Association's policies and listed the current activities of the parent Association. He stated that the American Water Works Association emerged from the wartime period stronger and better organized than at any time in its history. He particularly stressed the importance of public relations or goodwill and suggested that advertising on a national level, as well as in the local communities, would do much to elevate the industry in the minds of the public served.

E. L. Filby, Cons. Engr., Black & Veatch, Kansas City, Mo., and Chairman of the Survey Committee on Public Relations, described the work of his Committee, pointing out the way to spread goodwill to the public. He emphasized the many benefits that would accrue to the industry and the personnel engaged therein from a sound publicity and public relations program.

H. W. Blakeman, Louisiana Trustee, and Supt. of the Light and Water Plant, Rayville, La., explained the origin and making of the various electrical terms used by water works men. He emphasized the desirability of periodical checking of electrical equipment and listed items of maintenance routine usually required to keep electrical equipment and appurtenances in good operating condition.

K. F. Hoeffle, Asst. Supt., Water Dept., Dallas, Tex., showed in his discussion how many of the innovations adopted as a result of manpower shortage during the war had actually improved the efficiency of the department and created customer goodwill. He indicated that bi-monthly meter readings, instead of monthly, and other changes would be maintained as permanent features of operations.

W. H. Sindt, Acting Div. Engr., Bureau of Community Facilities, Federal Works Agency, presented an interesting discussion on "How the Federal Works Agency May Assist in Developing Water Works Facilities." He explained how, through application to the Bureau of Community Facilities, federal funds could be advanced to aid in the preparation of plans for local public work, advising that authorization for said funds was covered by Title 5 of the Mobilization and the Reconversion Act of 1944. He submitted figures allotted to the four states of the Section, but emphasized that sums advanced are to be repaid into the Treasury when and if funds are made available for the construction of the local public works so planned.

The Fuller Award went to Mr. Robert Wolcott Harding for his "untiring efforts in behalf of the Southwest Section, and particularly for his outstanding service in the activation of the Texas Water and Sanitation Research Foundation."

# *control* **NO EXTRA COST!**

## **STYLED FOR TOMORROW**

this main operating panel, made up of 16 Limitamp controllers, is installed in a pumping plant. With Limitamp control, fault current is cut off before any short has time to harm contactor or motor.

**A G-E metal-enclosed control system  
will enhance the looks of your plant  
and give you time-saving centralized control**

**"A BEAUTIFUL layout, but it must have cost plenty!"** If that's your impression, may we point out—

—that the Cabinetrol layout that you see opposite actually cost less than a comparable, made-up assortment of individual controls would have cost. It cost less *initially*. It is costing less to operate and *maintain*. The Limitamp control panels above offer similar economy for high-voltage drives.

The savings in installation cost that you get with a pre-engineered G-E metal-enclosed control will usually far outweigh its higher cost. It is delivered completely wired and ready to install as a unit. No racks to build. No waiting to accumulate a lot of different components.

Metal-enclosed control is inherently safer and easier to maintain. Each controller is segregated in its own individual compartment so that it can be serviced separately. Interlocks prevent accidental opening of doors on live starters.

To save time and make the most of G-E metal-enclosed control, pump motors, and other equipment, let us start now to work with you and your consultants. By calling us in before your plans are "set," you will wind up with co-ordinated architectural and electrical plans that will assure less costly construction and a plant that will stay modern longer. *General Electric Company, Schenectady 5, N. Y.*

(Continued from page 58)

Through the reports made in this JOURNAL by Charles F. Meyerherm, member of the Public Water Supply Group of the Radio Technical Planning Board, JOURNAL readers have been kept abreast of the efforts of the A.W.W.A. to promote the establishment of a legal precedent for the use of specified radio wave lengths by water plants in emergencies. *The Pioneer*, house organ of the Niagara Alkali Co., New York City, recently enumerated the services rendered by commercial broadcasting stations to the water supply field. Commercial broadcasters have furthered the industry's efforts:

To educate consumers in conserving water supplies during drought or other emergencies.

To warn users against pollution or contamination of public water supplies; to prevent epidemics.

To notify citizens of approaching flood and/or hurricane; to instruct them in the procedure they are to follow before, during and after the emergency.

To locate and to facilitate the procurement of emergency supplies, medical services and equipment.

To correct false rumors and allay public fears.

To locate missing persons.

To promote campaigns and programs for the public good, such as Fire Prevention Week.

*The Pioneer* editorializes on emergency use of radio:

Judging from the experience of the water works and electric systems that have been using radio for a number of years and have gone through a variety of emergencies, emergency radio service is a tried and tested tool whose effectiveness and value in safeguarding the public interest and in maintaining, installing or restoring service in emergencies has much more than justified its cost. If this is true of those who bought and used this equipment in the development state, there is every reason to believe that the ratio of benefit to cost will be materially greater for new users of this equipment.

However, the important thing now is to get started thinking about emergency radio service and its possibilities in specific cases of trouble on specific water systems. For the effective emergency communication system must be designed to fit the job, to furnish the service which may be required under a number of radically different emergency conditions, and to function under any and all foreseeable emergency conditions which may exist on a particular water system or in its area of operations.

**A completely revised** edition of the Taylor combination handbook and catalog contains both simple and technical explanations of the meaning of pH control; specific discussions of the application of pH, chlorine and polyphosphate control to 35 processes, including water purification and sewage disposal; the precautions to be observed in making determinations; and descriptions of all Taylor outfits, including eight new sets. The booklet may be obtained upon request from W. A. Taylor & Co., 7300 York Rd., Baltimore 4, Md.

## IT'S COZY INSIDE

That Mathews on the street-corner, standing guard by day and cold December night, knows no Winter inwardly. It may be deep-buried in snow and ice, but inside all is dry, all is well. For the low-placed orifice *drains all the water out*. Ice can't form. Mathews Hydrants have been the world's standard for over 60 years. Some of the other reasons: All working parts contained in a removable barrel, replaceable in a few minutes; service can't be interrupted long; the pavement need not be broken; head can be rotated 360°; can be raised or lowered as desired; opens *against*, closes *with* pressure; large water-carrying areas; cannot rust; greased or oiled from outside; all friction-points bronze-protected. Simple in design, rugged, trouble-free, Mathews Hydrants are giving 24-hour-a-day dependable service everywhere in the world. There are some 400,000 of them now, and, quite understandably, the number is rising fast.

**FIRST AID FOR WATER MAINS!**

# Perchloron

REG. U. S. PAT. OFF.

**Instantaneous sanitizer for emergency breaks!**

The breakage of a water main at any point allows pollution to enter the water supply. Perchloron added to the water safeguards the supply by aiding in the elimination of such pollution.

Water works engineers have found Perchloron a dependable stand-by for just such emergencies because of its quick solubility, greater stability and high chlorine content.

In the water purification field, PERCHLORON is also used to sanitize small water systems, new mains, wells and swimming pools. Its properties include the oxidation of ferrous iron in water, the removal of hydrogen sulphide, the control of most types of algae and the destruction of chlorine susceptible bacteria.

PERCHLORON has been released by the military and is now available. Orders will be filled as promptly as we can meet demands.

# LEADITE

## Jointed for . . . Permanence with LEADITE

Generally speaking, most Water Mains are buried beneath the Earth's surface, to be forgotten,—they are to a large extent, laid for permanency. Not only must the pipe itself be dependable and long lived,—but the joints also must be tight, flexible, and long lived,—else leaky joints are apt to cause the great expense of digging up well-paved streets, beautiful parks and estates, etc.

Thus the "jointing material" used for bell and spigot Water Mains **MUST BE GOOD,—MUST BE DEPENDABLE,—** and that is just why so many Engineers, Water Works Men and Contractors aim to **PLAY ABSOLUTELY SAFE**, by specifying and using **LEADITE**.

Time has proven that **LEADITE** not only makes a tight durable joint,—but that it improves with age.

*The pioneer self-caulking material for c. i. pipe.  
Tested and used for over 40 years.  
Saves at least 75%*
